 DR  
 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 215; 378pp; English.  
 CC  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 XX (ALNY-) ALNYLAM PHARM.  
 PA Manoharan M, Bumcrot D;  
 XX WPI; 2004-677362/66.  
 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 463; 378pp; English.  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 XX  
 PS Example 5; SEQ ID NO 507; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity, a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC hyperlipidaemias, hypercholesterolaemia, statin-resistant  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidaemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 760; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control ApoB gene expression.

Interference RNA agent useful for treating dyslipidemia, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 760; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 809; 378pp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense

CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 875; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX can be used to control ApoB gene expression.

 XX  
 PS Example 5; SEQ ID NO 953; 378pp; English.  
 XX  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC The subject is suffering from a disorder characterised by elevated or

CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance, the  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 PS Example 5; SEQ ID NO 953; 378pp; English.  
 XX  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC The subject is suffering from a disorder characterised by elevated or

 XX Example 5; SEQ ID NO 959; 378pp; English.  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

sequence and antisense sequence which has specific modifications.
Example 5; SEQ ID NO 989; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a
sense sequence and an antisense sequence, where the sense sequences have
one or more asymmetrical 2'-O alkyl modifications, the antisense
sequences have one or more asymmetrical phosphorothioate modifications
and the antisense sequence targets a human gene sequence. Also described
are a pharmaceutical preparation comprising (I); reducing (M1) apob-100
levels or glucose-6-phosphatase levels in a subject; producing (I);
stabilising (I), involves selecting a sequence with activity and
introducing one or more asymmetrical modification in the sequence, where
the modification decreases nuclease sensitivity while not decreasing its
activity; a kit comprising (I) and instruction for its use; and a device
that can be dispense or administer a composition comprising (I). (I) is
useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
The subject is suffering from a disorder characterised by elevated or
otherwise unwanted expression of apob-100, elevated or otherwise unwanted
levels of cholesterol, and/or dysregulation of lipid metabolism. The
disorder is chosen from the HDL/LDL cholesterol imbalance,
dyslipidaemias, hypercholesterolaemia, statin-resistant
disease (CHD) and atherosclerosis. (I) is administered to a subject to
inhibit hepatic glucose production or for treating glucose-metabolism-
related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
treating the diseases as mentioned above, cancer (e.g. breast, colon or
lung cancer), neurological disease (e.g., Huntington disease or
spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
can be used to control ApoB gene expression.

sequence and antisense sequence which has specific modifications.
Example 5; SEQ ID NO 1000; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a
sense sequence and an antisense sequence, where the sense sequences have
one or more asymmetrical 2'-O alkyl modifications, the antisense
sequences have one or more asymmetrical phosphorothioate modifications
and the antisense sequence targets a human gene sequence. Also described
are a pharmaceutical preparation comprising (I); reducing (M1) apob-100
levels or glucose-6-phosphatase levels in a subject; producing (I);
stabilising (I), involves selecting a sequence with activity and
introducing one or more asymmetrical modification in the sequence, where
the modification decreases nuclease sensitivity while not decreasing its
activity; a kit comprising (I) and instruction for its use; and a device
that can be dispense or administer a composition comprising (I). (I) is
useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
The subject is suffering from a disorder characterised by elevated or
otherwise unwanted expression of apob-100, elevated or otherwise unwanted
levels of cholesterol, and/or dysregulation of lipid metabolism. The
disorder is chosen from the HDL/LDL cholesterol imbalance,
dyslipidaemias, hypercholesterolaemia, statin-resistant
disease (CHD) and atherosclerosis. (I) is administered to a subject to
inhibit hepatic glucose production or for treating glucose-metabolism-
related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
treating the diseases as mentioned above, cancer (e.g. breast, colon or
lung cancer), neurological disease (e.g., Huntington disease or
spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
can be used to control ApoB gene expression.

XX

PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 PS  
 XX  
 XX  
 CC Example 5; SEQ ID NO 1378; 378pp; English.  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequence  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications

CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 XX PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 1336; 378pp; English.  
 XX CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

 XX (ALNY-) ALNYLAM PHARM.  
 XX Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 1973; 378pp; English.  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX

PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 disease, diabetes, cancer or neurological disease, comprises sense  
 sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 2011; 378pp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 sense sequence and an antisense sequence, where the sense sequences have  
 one or more asymmetrical 2'-O alkyl modifications, the antisense  
 sequences have one or more asymmetrical phosphorothioate modifications  
 and the antisense sequence targets a human gene sequence. Also described  
 are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 levels or glucose-6-phosphatase levels in a subject; producing (I);  
 stabilising (I), involves selecting a sequence with activity and  
 introducing one or more asymmetrical modification in the sequence, where  
 the modification decreases nuclease sensitivity while not decreasing its  
 activity; a kit comprising (I) and instruction for its use; and a device  
 that can be dispense or administer a composition comprising (I). (I) is  
 useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 The subject is suffering from a disorder characterised by elevated or  
 otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 disorder is chosen from the HDL/LDL cholesterol imbalance,  
 dyslipidaemias, hypercholesterolaemia, statin-resistant  
 hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 inhibit hepatic glucose production or for treating glucose-metabolism-  
 related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 lung cancer), neurological disease (e.g., Huntington disease or  
 spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 can be used to control ApoB gene expression.

 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 2044; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instructions for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.  
 XX

```

CC are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control ApoB gene expression.

 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Example 5; SEQ ID NO 2766; 378bp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyi modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX dyslipidaemia, hypercholesterolaemia, statin-resistant
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX lung cancer), neurological disease (e.g., Huntington disease or
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX can be used to control Apob gene expression.

Interference RNA agent useful for treating dyslipidaemia, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.  
Example 5; SEQ ID NO 2771; 378bp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)

is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemia, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 2963; 378bp; English.
XX
CC The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I1)
CC stabilising (I1), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological diseases (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control Apob gene expression.

XX
PT Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 2964; 378bp; English.
XX
CC The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I1)
CC stabilising (I1), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological diseases (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control Apob gene expression.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

PS Example 5; SEQ ID NO 3081; 378bp; English

The invention describes a RNA interference (RNAi) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequence have one or more asymmetrical 2'-O-alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100 levels or glucose-6-phosphatase levels in a subject; producing (I1) stabilising (I1), involve selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterized by elevated or otherwise unwanted expression of apob-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological diseases (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

 PI Manoharan M, Bumcrot D;  
 PT WPI; 2004-677362/66.  
 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprising sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 3377; 378bp; English.  
 XX  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I1)  
 CC stabilising (I1), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its

activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apob-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, CC dyslipidaemia, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (Apob) antisense oligonucleotide that can be used to control Apob gene expression.

 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 3429; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX Interference RNA agent useful for treating dyslipidemias, coronary artery

XX disease, diabetes, cancer or neurological disease, comprises sense

XX sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 3485; 378bp; English.

XX

CC The invention describes a RNA interference (iRNA) agent (I) comprising a

CC sense sequence and an antisense sequence, where the sense sequences have

CC one or more asymmetrical 2'-O alkyl modifications, the antisense

CC sequences have one or more asymmetrical phosphorothioate modifications

CC and the antisense sequence targets a human gene sequence. Also described

CC are: a pharmaceutical preparation comprising (I); reducing (M) apob-100

CC levels or glucose-6-phosphatase levels in a subject; producing (I);

CC stabilising (I); involves selecting a sequence with activity and

CC introducing one or more asymmetrical modification in the sequence, where

CC the modification decreases nuclease sensitivity while not decreasing its

CC activity; a kit comprising (I) and instruction for its use; and a device

CC that can be dispense or administer a composition comprising (I). (I) is

CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)

CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.

CC The subject is suffering from a disorder characterised by elevated or

CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

CC disorder is chosen from the HDL/LDL cholesterol imbalance,

CC dyslipidaemias, hypercholesterolaemia, statin-resistant

CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart

CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

CC inhibit hepatic glucose production or for treating glucose-metabolism-

CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

CC treating the diseases as mentioned above, cancer (e.g. breast, colon or

CC lung cancer), neurological disease (e.g., Huntington disease or

CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

CC can be used to control ApoB gene expression.

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 3536; 378bp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100 levels or glucose-6-phosphatase levels in a subject; producing (I);

CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 3607; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX Interference RNA agent useful for treating dyslipidemiae, coronary artery

PT disease, diabetes, cancer or neurological disease, comprises sense

PT sequence and antisense sequence which has specific modifications.

XX

PS Example 5; SEQ ID NO 3654; 378bp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a

CC sense sequence and an antisense sequence, where the sense sequences have

CC one or more asymmetrical 2'-O alkyl modifications, the antisense

CC sequences have one or more asymmetrical phosphorothioate modifications

CC and the antisense sequence targets a human gene sequence. Also described

CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100

CC levels or glucose-6-phosphatase levels in a subject; producing (I);

CC stabilising (I), involves selecting a sequence with activity and

CC introducing one or more asymmetrical modification in the sequence, where

CC the modification decreases nuclease sensitivity while not decreasing its

CC activity; a kit comprising (I) and instruction for its use; and a device

CC that can be dispense or administer a composition comprising (I). (I) is

CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)

CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.

CC The subject is suffering from a disorder characterised by elevated or

CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

CC disorder is chosen from the HDL/LDL cholesterol imbalance, the

CC dyslipidemiae, hypercholesterolaemia, statin-resistant

CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart

CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

CC inhibit hepatic glucose production or for treating glucose-metabolism-

CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

CC treating the diseases as mentioned above, cancer (e.g. breast, colon or

CC lung cancer), neurological disease (e.g., Huntington disease or

CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

CC can be used to control Apob gene expression.

 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

 Interference RNA agent useful for treating dyslipidemia, coronary artery  
 disease, diabetes, cancer or neurological disease, comprises sense  
 sequence and antisense sequence which has specific modifications.  
 Example 5; SEQ ID NO 3683; 378bp; English.

The invention describes a RNA interference (RNA) agent (I) comprising a  
 sense sequence and an antisense sequence, where the sense sequence  
 has one or more asymmetrical 2'-O alkyl modifications, the antisense  
 sequences have one or more asymmetrical phosphorothioate modifications  
 and the antisense sequence targets a human gene sequence. Also described  
 are: a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 levels or glucose-6-phosphatase levels in a subject; producing (I);  
 stabilising (I); involves selecting a sequence with activity and  
 introducing one or more asymmetrical modification in the sequence, where  
 the modification decreases nucleic acid sensitivity while not decreasing its  
 activity; a kit comprising (I) and instruction for its use; and a device  
 that can be dispensed or administered a composition comprising (I). (I) is  
 useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)  
 is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 The subject is suffering from a disorder characterised by elevated or  
 otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 disorder is chosen from the HDL/LDL cholesterol imbalance,  
 dyslipidemia, hypercholesterolaemia, statin-resistant  
 hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 inhibit hepatic glucose production or for treating glucose-metabolism-  
 related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 lung cancer), neurological disease (e.g., Huntington disease or  
 spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 can be used to control Apob gene expression.

 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (apob) antisense oligonucleotide that

CC can be used to control Apob gene expression.

 XX (ALNY-) ALNYLAM PHARM.  
 PA Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 DR Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 4422; 378bp; English.  
 PS The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications

CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX Manoharan M, Bumcrot D;

XX WPI; 2004-677362/66.

XX Interference RNA agent useful for treating dyslipidemias, coronary artery

XX disease, diabetes, cancer or neurological disease, comprises sense

XX sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 4814; 378pp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a

XX sense sequence and an antisense sequence, where the sense sequences have

XX one or more asymmetrical 2'-O alkyl modifications, the antisense

XX sequences have one or more asymmetrical phosphorothioate modifications

XX and the antisense sequence targets a human gene sequence. Also described

XX are: a pharmaceutical preparation comprising (I); reducing (M) apob-100

XX levels or glucose-6-phosphatase levels in a subject; producing (I);

XX stabilising (I), involves selecting a sequence with activity and

XX introducing one or more asymmetrical modification in the sequence, where

XX the modification decreases nuclease sensitivity while not decreasing its

XX activity; a kit comprising (I) and instruction for its use; and a device

XX that can be dispense or administer a composition comprising (I). (I) is

XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)

XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.

XX The subject is suffering from a disorder characterised by elevated or

XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted

XX levels of cholesterol, and/or dysregulation of lipid metabolism. The

XX disorder is chosen from the HDL/LDL cholesterol imbalance, the

XX dyslipidemia, hypercholesterolaemia, statin-resistant

XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart

XX disease (CHD) and atherosclerosis. (I) is administered to a subject to

XX inhibit hepatic glucose production or for treating glucose-metabolism-

XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

XX treating the diseases as mentioned above, cancer (e.g. breast, colon or

XX lung cancer), neurological disease (e.g., Huntington disease or

XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

XX represents a human apolipoprotein B (Apob) antisense oligonucleotide that

XX can be used to control Apob gene expression.

 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 5121; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (ML) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is

CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterized by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX Interference RNA agent useful for treating dyslipidaemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprising sense  
 PT sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 1004; 378pp; English.

PS The invention describes a RNA interference (iRNA) agent (I) comprising a  
 XX sense sequence and an antisense sequence, where the sense sequences have  
 XX one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidaemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 3948; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
XX levels or glucose-6-phosphate levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apob-100 levels or glucose-6-phosphate levels. (M1)
XX is useful for reducing apob-100 levels or glucose-6-phosphate levels.
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX dyslipidaemias, hypercholesterolaemia, statin-resistant
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX lung cancer), neurological disease (e.g., Huntington disease or
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX can be used to control Apob gene expression.

PT disease, diabetes, cancer or neurological disease, comprises sense

PT sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 1186; 378bp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a

CC sense sequence and an antisense sequence, where the sense sequences have

CC one or more asymmetrical 2'-O alkyl modifications, the antisense

CC sequences have one or more asymmetrical phosphorothioate modifications

CC and the antisense sequence targets a human gene sequence. Also described

CC are: a pharmaceutical preparation comprising (I); reducing (M) apob-100

CC levels or glucose-6-phosphatase levels in a subject; producing (I);

CC stabilising (I), involves selecting a sequence with activity and

CC introducing one or more asymmetrical modification in the sequence, where

CC the modification decreases nuclease sensitivity while not decreasing its

CC activity; a kit comprising (I) and instruction for its use; and a device

CC that can be dispense or administer a composition comprising (I). (I) is

CC useful for reducing apob-100 levels or glucose-6-phosphatase levels.

CC The subject is suffering from a disorder characterised by elevated or

CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

CC disorder is chosen from the HDL/LDL cholesterol imbalance,

CC dyslipidaemias, hypercholesterolaemia, statin-resistant

CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart

CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

CC inhibit hepatic glucose production or for treating glucose-metabolism-

CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

CC treating the diseases as mentioned above, cancer (e.g. breast, colon or

CC lung cancer), neurological disease (e.g., Huntington disease or

CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

CC can be used to control ApoB gene expression.

 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX (ALNY-) ALNYTAM PHARM.
XX
XX Manoharan M, Bumcrot D;
XX WPI; 2004-677362/66.
XX
XX Inference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 2172; 378bp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I); involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX hypercholesterolaemia, coronary artery disease, statin-resistant
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX lung cancer), neurological disease (e.g., Huntington disease or
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX can be used to control Apob gene expression.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

PS Example 5; SEQ ID NO 4930; 378bp; English.

CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilizing (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I), and a device  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterized by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance, the  
 CC dyslipidemia, hypercholesterolemia, statin-resistant  
 CC hypercholesterolemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX
XX Claim 1; SEQ ID NO 326; 405bp; English.
XX
XX The invention relates to a novel antisense compound targeted to a nucleic
XX acid molecule encoding human apolipoprotein B (Apob) which specifically
XX hybridises with and inhibits the expression of human apolipoprotein B.
XX The compound of the invention demonstrates antiarteriosclerotic,
XX cardiant, antidiabetic and anorectic activities and may be useful for
XX preparing a composition for treating abnormal lipid or cholesterol
XX metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidemia or
XX cardiovascular disease. Furthermore, the compound has gene therapy
XX applications. The current sequence is that of the 2'-O-methoxyethyl (2'-
XX MOE) gapper antisense oligo of the invention which has 2'-MOE 'wings', a
XX phosphorothioate backbone throughout and in which all cytidine residues
XX are 5-methylcytidines.

XX response. The method comprises administering an immunostimulatory nucleic
XX acid to a non-rodent subject in sufficient quantity to stimulate an
XX immune response. The present sequence is one such immunostimulatory
XX nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
XX (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
XX against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
XX and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
XX haemophilus, campylobacter, clostridium, Escherichia coli and/or
XX staphylococcus), fungal antigens and/or parasitic antigens. The method is
XX also useful for preventing cancer, asthma, infectious disease, allergy or
XX immune deficiency. The present sequence can also be used to redirect a
XX Th2 to a Th1 immune response and to activate immune cells. Note: the
XX present sequence may have a phosphorochioate backbone

XX
XX Modulating p53-mediated apoptotic cell death in a population of cells, by
XX PT modulating the amount of a transcriptional regulator of apoptosis
XX PT available to bind to a target polynucleotide in the cells.
XX
XX Example 2; Page 57; 62pp; English.
XX
XX The present invention relates to methods for modulating apoptotic cell
XX death using proteinaceous transcription factors that regulate the
XX transcription of genes encoding proteins involved in apoptosis (e.g. CD95
XX and p53). The methods involve modulating the amount of a transcriptional
XX regulator of apoptosis (TRA) available to bind to a target polynucleotide
XX in the cells, where TRA is a member of the Y-box nucleic acid binding
XX family of polypeptides (e.g. YB-1). The methods of the invention are
XX useful for modulating apoptotic cell death in a population of cells,
XX where the cells are selected from tumour cells, cells of the immune
XX system, embryonic cells, cells of the nervous system, or cells infected
XX with intracellular pathogens. The methods are also useful for increasing
XX the sensitivity of tumour cells to a DNA-damaging agent, and for
XX increasing sensitivity to apoptosis in a population of cells harbouring
XX intracellular pathogens. The methods are useful for screening an
XX apoptosis modulatory agent that modulates the binding of TRA. The methods
XX for regulating apoptosis can be used therapeutically and prophylactically
XX for various disorders such as cancer, viral and retroviral infections,
XX neurodegenerative disorders, and immune system dysfunction. The present
XX sequence represents a phosphorothioate oligonucleotide to the anti-sense
XX strand of human Pur alpha

PT Characterizing a nucleic acid region, useful for detecting genetic
PT mutations in any large multi-exon gene e.g., those indicating
PT dystrophinopathy, comprises using a Single Condition
PT Amplification/Internal Primer (SCAIP) sequencing method.
XX
XX Example 1; Page 30; 174pp; English.
XX
XX The present invention relates to a Single Condition Amplification/
XX Internal Primer (SCAIP) sequencing method for direct sequence analysis of
XX large multi-exon genes from genomic DNA samples and identifying mutations
XX in multi-exon genes e.g. the dystrophin gene, CAPN3 gene and DISF gene.
XX Mutations in the dystrophin gene result in both Duchenne Muscular
XX Dystrophy (DMD) and Becker Muscular Dystrophy (BMD). Mutations in the
XX CAPN3 gene, encoding calpain (calcium-activated neutral protease) result
XX in limb-girdle muscular dystrophy type 2A (LGMD2A) and mutations in the
XX DISF gene, encoding dysferlin, result in limb-girdle muscular dystrophy
XX type 2B (LGMD2B). The method comprises bringing into contact in each of
XX the reaction chambers an amplicon from a different one of the
XX amplification reactions and one or more internal sequencing primers
XX corresponding to the amplicon and analysing the sequences of the
XX amplicons. The method allows for the rapid, accurate, and economical
XX analysis of any large multi-exon gene. The method is useful in detecting
XX genetic mutations in any large multi-exon gene. It is also useful for the
XX identification and analysis of specific individual genomic mutations
XX including deletions, point mutations, or its combinations, gene complexes
XX with multiple exons/intons spanning large genomic regions. The present
XX sequence is a PCR primer, used in the method of the invention.

XX
CC The present invention describes a method for inhibiting the expression of
CC a gene in a cell comprising contacting the cell with an effective
CC synergistic amount of an antisense oligonucleotide which inhibits
CC expression of the gene, and an effective synergistic amount of a protein
CC effector of a product of the gene. Also described are: (1) a method for
CC treating a disease responsive to inhibition of a gene in a mammal; (2) a
CC method for inhibiting tumour growth in mammal; (3) an inhibitor of a gene
CC comprising an antisense oligonucleotide which inhibits expression of the
CC gene in operable association with a protein effector of a gene product;
CC and (4) a pharmaceutical composition comprising the inhibitor of (3). The
CC methods and compositions are useful as analytical tools for transgenic
CC studies and as therapeutic tools, e.g. as gene therapy tools for human
CC diseases including benign and malignant tumours, inflammation or asthma.
CC The methods, inhibitors and compositions of the invention that inhibit
CC expression or activity of a gene or gene product may be used to treat
CC patients having, or predisposed to developing, a disease responsive to
CC inhibition of the gene. These may also be used to activate silenced genes
CC to provide missing gene functions and improve a given condition.
CC Furthermore, the methods and compositions are useful as probes of the
CC physiological function of a gene product in an experimental cell culture
CC or animal system; and to evaluate the effect of inhibiting gene activity
```

PT New inhibitors of histone deacetylase e.g. N-hydroxy-5-(4-
PT (benzenesulfonylamino)-phenyl)-4-yn-2-pentanamide for treating cancer,
PT restenosis or fungal infections.
XX
PS Disclosure; Page 40; 147pp; English.
XX
CC The sequences given in AAH43115-21 are oligonucleotides which are
CC antisense to the histone deacetylase gene, HDAC-2. These oligonucleotides
CC may be used in combination with an inhibitor of histone deacetylase
CC enzyme function, to given an improved inhibitory effect, thereby reducing
CC the amount of inhibitor required to obtain a given inhibitory effect.
CC Compounds containing these oligonucleotides may be used to treat cell
CC proliferation conditions such as cancer, restenosis or psoriasis. They
CC can also be used to treat protozoal and fungal infections

PS Claim 15; SEQ ID NO 1310; 763bp; English.

XX This invention describes a novel composition (a) a first active agent,  
 XX comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers; (b) the oligonucleotides; (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hyperextension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.

XX PS Claim 15; SEQ ID NO 1309; 763bp; English.

XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers; (b) the oligonucleotides; (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory

PT New antisense compound, useful for preparing a composition for treating  
PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type  
PT 2, obesity, hyperlipidaemia or cardiovascular disease.

PS Claim 1; SEQ ID NO 329; 405pp; English.

XX The invention relates to a novel antisense compound targeted to a nucleic  
CC acid molecule encoding human apolipoprotein B (Apob) which specifically  
CC hybridises with and inhibits the expression of human apolipoprotein B.  
CC The compound of the invention demonstrates antiarteriosclerotic,  
CC cardiant, antidiabetic and anorectic activities and may be useful for  
CC preparing a composition for treating abnormal lipid or cholesterol  
CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
CC cardiovascular disease. Furthermore, the compound has gene therapy  
CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a  
CC phosphorothioate backbone throughout and in which all cytidine residues  
CC are 5-methylcytidines.

PS      Example 15; SEQ ID NO 12; 74pp; English.
XX
CC      The invention relates to a compound targeted to a nucleic acid molecule
CC      encoding the human Notch3 polypeptide. The compound is an antisense
CC      oligonucleotide that specifically hybridises with the nucleic acid and
CC      inhibits expression of the polypeptide. The antisense oligonucleotide
CC      comprises at least one modified internucleoside linkage i.e. a
CC      phosphorothioate linkage, at least one modified sugar moiety, preferably
CC      a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase
CC      comprising a 5-methylcytosine. The antisense compounds are useful for
CC      modulating the expression of the human Notch3 polypeptide and in
CC      preparation of a composition for treating hyperproliferative disorders,
CC      e.g. cancer. This sequence represents a human Notch3 DNA antisense
CC      oligonucleotide of the invention.

XX
CC      The invention relates to a novel antisense compound where the compound
CC      hybridises to and inhibits expression of mRNA encoding human
CC      apolipoprotein B (Apob) after 16-24 hours by at least 30% in 80%
CC      confluent HepG2 cells in culture at a concentration of 150 nM. The
CC      compound of the invention demonstrates cardiovascular,
CC      antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiact,
CC      vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
CC      endocrine, vasotropic, neuroprotective and nootropic activities and may
CC      be useful for inhibiting the expression of apolipoprotein B in cells or
CC      tissues in vivo in order to address a condition associated with abnormal
CC      lipid or cholesterol metabolism. The compound may be useful for
CC      decreasing circulating lipoprotein levels, triglyceride levels,
CC      reactants and chylomicrons and thus may be utilised during treatment of
CC      hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
CC      cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
CC      syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
CC      anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
CC      impotence, obstructive liver disease, Alzheimer's disease, dementia,
CC      diabetes, obesity and atherosclerosis. The current sequence is that of an
CC      antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
CC      targeted to human Apob RNA.

 XX  
 XX Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX  
 XX Example 36; SEQ ID NO 691; 483bp; English.  
 PS  
 XX The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antidiabetic, antihypertensive, antilipemic, antidiabetic, anorectic, cardiant,  
 CC endocrine, vasotropic, neuroprotective and neurotropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of a  
 CC human apolipoprotein B (ApoB) antisense therapy target DNA of the  
 CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cyostatic,
XX endocrine, vasotropic, neuroprotective and nootropic activities and may
XX be useful for inhibiting the expression of apolipoprotein B in cells or
XX tissues in vivo in order to address a condition associated with abnormal
XX lipid or cholesterol metabolism. The compound may be useful for
XX decreasing circulating lipoprotein levels, triglyceride levels,
XX cholesterol levels, lipid levels, fatty acid levels, acute phase
XX reactants and chylomicrons and thus may be utilised during treatment of
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's
XX syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX diabetes, obstructive liver disease, Alzheimer's disease, dementia,
XX impotence, obesity and atherosclerosis. The current sequence is that of an
XX antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX targeted to human ApoB-100 RNA.

 PT Composition for treating hormone-regulated cancer, particularly of  
 PT prostate or breast, comprises oligonucleotide antisense to insulin-like  
 PT growth factor binding protein-2.  
 XX  
 PS Claim 3; Page 12; 36pp; English.  
 XX  
 CC The present invention relates to a new composition for treating hormone-  
 CC regulated cancer. The composition comprises an antisense oligonucleotide  
 CC that inhibits expression of IGFBP-2 (Insulin-like growth factor binding  
 CC protein-2). The molecules of the invention are used to delay progression  
 CC of hormone-regulated tumours, particularly of breast or prostate, to the  
 CC hormone-independent state, to delay metastatic progression to the bone of  
 CC IGF-1-sensitive cancers and to treat hormone-responsive cancers by  
 CC inducing apoptosis, after hormonal withdrawal. The present nucleic acid  
 CC sequence represents one of a collection (ABK70313-ABK70375) of antisense  
 CC IGFBP-2-oligodeoxynucleotides (ODN) that were used in the invention for  
 CC prostate and other endocrine tumour therapy

XX
XX
XX Generating substantially homogeneous population of undifferentiated cells
XX from sample, by disrupting tissue sample, discriminating cells in
XX population based on size and performing cell-surface marker-
XX discrimination.
XX
XX Example 10; Page 46, 90pp; English.
XX
XX The present invention describes a method (M) for generating a
XX substantially homogeneous population of undifferentiated cells (UC) from
XX a biological sample (BS), which comprises subjecting BS or its sub-sample
XX to tissue-disruption to provide a mixed population (MP) comprising UC,
XX subjecting MP to a cell size-discrimination (SD) step, and simultaneously
XX or sequentially with SD, subjecting the cell population obtained to a
XX cell-surface marker-discrimination step. Also described: (1) a
XX substantially homogeneous population of undifferentiated cells (I)
XX prepared by (M); (2) a composition (II) for use in cell replacement
XX therapy, comprising a population of substantially homogeneous population
XX of neural stem cells (NSCs) generated by (M); and (3) a composition (III)
XX comprising a growth factor identified using a homogeneous population of
XX NSCs generated by (M). (I) can have neurotropic, neuroprotective and
XX antiapoptotic activities, and can be used in gene therapy. (M) is
XX useful for generating a substantially homogeneous population of
XX undifferentiated cells such as NSCs from a biological sample, and is
XX useful for the replacement of neural or non-neural tissue in an animal.
XX (II) is useful in cell replacement therapy in an organ such as the brain
XX or in the nervous system, preferably central nervous system (CNS), for
XX treating a CNS disorder such as Alzheimer's disease, Parkinson's disease,
XX acute brain injury and CNS dysfunction. (I) is useful for the repair or
XX regeneration of tissue. AB280278 to AB280363 represent PCR primers which
XX are used in an example from the present invention for markers defining
XX cell populations

XX Constructing synthetic polynucleotide for modulating the quality of a  
 PT selected phenotype displayed by an organism comprises replacing a first  
 PT codon with a synonymous codon to construct the synthetic polynucleotide.

XX Example 1; SEQ ID NO 67; 86bp; English.

XX The present invention describes a method for constructing a synthetic  
 CC polynucleotide from which a polypeptide is producible to confer a  
 CC selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. The method comprises: (a) selecting a first codon of  
 CC the parent polynucleotide for replacement with a synonymous codon, where  
 CC the synonymous codon is selected on the basis that it exhibits a  
 CC different phenotypic preference than the first codon in a comparison of  
 CC phenotypic preferences in test organisms or parts, where the test  
 CC organism are selected from organisms of the same species as the organism  
 CC of interest and organisms that are related to the organisms of interest;  
 CC and (b) replacing the first codon with the synonymous codon to construct  
 CC the synthetic polynucleotide. Also described: (1) a method for  
 CC determining the phenotypic preference of a first codon in an organism of  
 CC interest or its parts; (2) a synthetic polynucleotide constructed from  
 CC the method above; (3) an organism of interest or part containing a  
 CC synthetic polynucleotide constructed from the method above; (4) an  
 CC organism of interest or part containing a synthetic construct that  
 CC comprises a regulatory polynucleotide operably linked to a tandem repeat  
 CC of a first codon fused in frame with a reporter polynucleotide that  
 CC encodes a reporter protein, which produces, or is predicted to produce a  
 CC selected phenotype or a phenotype of the same class as the selected  
 CC phenotype in the organism or part; (5) a method of modulating the quality  
 CC of a selected phenotype that is displayed by an organism of interest or  
 CC part and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; (6) a method of enhancing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; and (7) a method of reducing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide. The method is useful for constructing a  
 CC synthetic polynucleotide from which a polypeptide is producible to confer  
 CC a selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the

CC same polypeptide. It is useful for modulating the quality of a selected  
 CC phenotype displayed by an organism or part. The present sequence encodes  
 CC a synthetic leader sequence, which is used in an example from the present  
 CC invention.

PT Constructing synthetic polynucleotide for modulating the quality of a  
 PT selected phenotype displayed by an organism comprises replacing a first  
 PT codon with a synonymous codon to construct the synthetic polynucleotide.

PS Example 1; SEQ ID NO 37; 86pp; English.

XX The present invention describes a method for constructing a synthetic  
 CC polynucleotide from which a polypeptide is producible to confer a  
 CC selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. The method comprises: (a) selecting a first codon of  
 CC the parent polynucleotide for replacement with a synonymous codon, where  
 CC the synonymous codon is selected on the basis that it exhibits a  
 CC different phenotypic preference than the first codon in a comparison of  
 CC phenotypic preferences in test organisms or parts, where the test  
 CC organism are selected from organisms of the same species as the organism  
 CC of interest and organisms that are related to the organisms of interest;  
 CC and (b) replacing the first codon with the synonymous codon to construct  
 CC the synthetic polynucleotide. Also described: (1) a method for  
 CC determining the phenotypic preference of a first codon in an organism of  
 CC interest or its parts; (2) a synthetic polynucleotide constructed from  
 CC the method above; (3) an organism or interest or part containing a  
 CC synthetic polynucleotide constructed from the method above; (4) an  
 CC organism or interest or part containing a synthetic construct that  
 CC comprises a regulatory polynucleotide operably linked to a tandem repeat  
 CC of a first codon fused in frame with a reporter polynucleotide that  
 CC encodes a reporter protein, which produces, or is predicted to produce a  
 CC selected phenotype or a phenotype of the same class as the selected

CC phenotype in the organism or part; (5) a method of modulating the quality  
 CC of a selected phenotype that is displayed by an organism of interest or  
 CC part and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; (6) a method of enhancing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; and (7) a method of reducing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide. The method is useful for constructing a  
 CC synthetic polynucleotide from which a polypeptide is producible to confer  
 CC a selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. It is useful for modulating the quality of a selected  
 CC phenotype displayed by an organism or part. The present sequence encodes  
 CC a synthetic leader sequence, which is used in an example from the present  
 CC invention.

PT Constructing synthetic polynucleotide for modulating the quality of a  
 PT selected phenotype displayed by an organism comprises replacing a first  
 PT codon with a synonymous codon to construct the synthetic polynucleotide.

PS Example 1; SEQ ID NO 89; 86pp; English.

XX The present invention describes a method for constructing a synthetic  
 CC polynucleotide from which a polypeptide is producible to confer a  
 CC selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. The method comprises: (a) selecting a first codon of  
 CC the parent polynucleotide for replacement with a synonymous codon, where  
 CC the synonymous codon is selected on the basis that it exhibits a  
 CC different phenotypic preference than the first codon in a comparison of  
 CC phenotypic preferences in test organisms or parts, where the test

organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an organism or interest or part containing a synthetic construct that comprises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that encodes a reporter protein, which produces, or is predicted to produce a selected phenotype or a phenotype of the same class as the selected phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that encodes the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that encodes the polypeptide; and (7) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that encodes the polypeptide. The method is useful for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes a synthetic leader sequence, which is used in an example from the present invention.

XX
XX Identifying biological sample of mammal, involves obtaining amplification
XX data indicative of amplification of DNA markers of genomic DNA of mammal,
XX generating indicia indicative of amplification data, associating indicia
XX with sample.
XX
XX Example; Page 19; 39pp; English.
XX
XX The invention describes a method of identifying (M1) a biological sample
XX comprising a biological material of a mammal. The method involves
XX obtaining amplification data indicative of amplification of at least two
XX DNA markers of genomic DNA of the mammal, generating indicia indicative
XX of the amplification data, and associating the indicia with the
XX biological sample, where the indicia is used to identify the biological
XX sample. (M1) is useful in identifying biological sample of a subject
XX undergoing diagnosis to determine whether the subject is afflicted with a
XX particular disease or disorder; for identifying a biological sample of a
XX subject, undergoing screening for genetic lesions or mutations; for
XX identifying a biological sample of a subject, being diagnosed for the
XX presence of target microorganism chosen from virus, bacteria, fungi or
XX protozoa, where the virus includes HIV-1, human T-cell lymphotropic
XX virus type 1 (HTLV-1), Hepatitis B virus (HBV), Hepatitis C virus (HCV)
XX and Herpes Simplex, the bacteria includes Mycobacterium tuberculosis,
XX Rickettsia rickettsii, Ehrlichia chaffeensis, Borrelia burgdorferi and
XX Yersinia pestis, the fungi includes Cryptococcus neoformans, Pneumocystis

```

```

CC carini and Histoplasma capsulatum, and the protozoa is chosen from
CC Trypanosoma cruzi, Leishmania sp., Plasmodium, Entamoeba histolytica,
CC Babesia microti, Giardia lamblia, Cyclospora sp. and Eimeria sp.; in
CC identifying a biological sample of a subject undergoing paternity
CC screening, genetic screening, prenatal diagnosis, presymptomatic
CC diagnosis, disease carrier detection or forensic chemical analysis; in
CC identifying a biological sample during the screening of the plant to
CC detect the presence of the target microorganism, or during carrier
CC detection analysis or forensic chemical analysis of a plant; and in
CC diagnostic medicines, for identification of genetically inherited
CC diseases in humans, family relationship analysis and microbial typing.
CC (M1) enables simultaneous analysis and tracking of biological samples.
CC The molecular barcode of the genomic DNA of the sample can be determined
CC at any time during the collection or processing of a biological sample.
CC This sequence represents an example of a short tandem or microsatellite
CC repeat that can be used in DNA fingerprinting to identify a biological
CC material.

 PS Example 5; SEQ ID NO 4259; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nucleic acid sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)
XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
XX The subject is suffering from a disorder characterised by elevated or

```

```

CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control Apob gene expression.

XX  
XX Analysing nucleic acid samples - using amplification primers which  
PT contain CAG or CTG tri-nucleotide repeats for differential display of  
PT samples from different sources.  
XX  
XX Example; Page 31; 44pp; English.  
XX  
XX This sequence represents an adapter primer oligonucleotide. It was used  
CC to isolate CAG repeat containing sequences from the human genome to test  
CC the method of the invention. The method is for analysing nucleic acids in  
CC a sample, and comprises: (a) providing a sample containing nucleic acid,  
CC a first oligonucleotide primer comprising a CTG repeat, a second  
CC oligonucleotide primer comprising a CAG repeat and a polymerase and PCR  
CC reagents; (b) preparing said nucleic acid so that it is amplifiable; (c)  
CC amplifying the nucleic acid with the first and second primers; and (d)  
CC detecting the amplified product. The method is used to distinguish  
CC between the expression of genes in two or more biological samples, e.g.  
CC body fluids, cells, solid tissue or solid and liquid foods. It can be  
CC used in medical diagnostics, e.g. to differentiate between normal and  
CC diseased tissue or to assess the variation within monozygotic twin pairs.  
CC The method allows the isolation and analysis of genome subsets containing  
CC CAG repeats which are known to be important in a number of neurological  
CC diseases including Huntington's chorea. The method uses PCR suppression,  
CC in which only fragments which contain a target repeat are efficiently  
CC amplified. This allows accurate identification of differentially  
CC expressed genes in various cell types. Genome complexity is reduced by  
CC the new method which targets genomic subsets containing CAG repeats

XX The invention relates to a novel set of inter-simple sequence repeats  
CC (ISSR)-PCR primers for genotyping eukaryotes. The primers of the  
CC invention may be useful for genotyping diverse genomes of plant and  
CC animal systems, in particular for distinguishing Basmati rice varieties  
CC from non-Basmati rice varieties and traditional Basmati rice varieties  
CC evolved from Basmati rice varieties. The current sequence is that of the  
CC ISSR-related PCR primer of the invention.

PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
PT ubiquinone.  
XX  
PS Claim 15; SEQ ID NO 838; 872pp; English.  
XX  
CC The invention relates to a novel pharmaceutical composition, which has a  
CC first active agent comprising an oligonucleotide antisense to the  
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
CC junctions of genes encoding a polypeptide associated with lung and/or  
CC nasal airway dysfunction and a second active agent comprising an  
CC antiinflammatory steroid and ubiquinone. A composition of the invention  
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
CC immunosuppressive, and cytostatic activity. The composition may have a  
CC use in antisense gene therapy. The composition is useful for treating or  
CC preventing a respiratory, lung or malignant disease or condition, also  
CC for enhancing the prophylactic or therapeutic respiratory effect of an

CC antiinflammatory steroid in a subject, for reducing or depleting levels  
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
CC lung inflammation, lung allergies, or a respiratory disease or condition.  
CC Note: The sequence data for this patent is not represented in the printed  
CC specification, but was obtained in electronic format directly from WIPO  
CC at ftp.wipo.int/pub/published\_pct\_sequences

CC This invention describes a novel composition (a) a first active agent,  
CC comprising oligonucleotides, effective for alleviating  
CC bronchoconstriction, respiratory tract inflammation, allergies and  
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
CC surfactant depletion or hyposecretion, when administered to a mammal.  
CC Oligonucleotides are derived from a gene encoding or regulating  
CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)

CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has anti-allergic, anti-inflammatory, antiaesthetic,  
CC analgesic, hypotensive, immunosuppressive and cytosratic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hyperextension, emphysema, chronic obstructive pulmonary disease, pulmonary  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
CC prevent any unwanted effects due to it

XX  
XX CC The oligonucleotide has a disulphide linker incorporated into the probe

CC which acts as a hybridisation-triggered crosslinking agent. This will  
CC permit novel diagnostic assay modifications such as the use of  
CC crosslinker to increase probe discrimination and incorporation of a  
CC denaturing wash step to reduce background. Also carrying out  
CC hybridisation and crosslinking at or near the melting temperature of the  
CC hybrid DNA will reduce secondary structure in the target DNA and increase  
CC probe specificity. See also AAQ14195

PT useful for identifying compounds and genes affecting Alzheimer's disease.
XX
PS Example 1, Page 41; 63pp; English.
XX
CC The present invention describes a nematode having a deletion in the hop-1
CC gene (homologue of presenilin-1) and optionally further in the sel-12
CC (suppressor +/-or enhancer of 11n-12) or spe-4 (spermatogenesis defective)
CC genes. The 3 genes are homologues of the mammalian presenilin genes which
CC affect the onset and course of Familial Alzheimer's Disease (FAD). The
CC nematodes can be used to screen for compounds and genes which affect the
CC course of Alzheimer's disease. The present sequence represents a PCR
CC primer used for screening for sel-12 deletions

## RESULT 2311

ACD68312

ID ACD68312 standard; DNA; 21 BP.

XX ACD68312;

DT 17-SEP-2003 (first entry)

XX Novel human secreted and transmembrane protein related primer #23.

Human; secreted and transmembrane protein; PRO; angiogenesis;  
endothelial cell proliferation; wound healing; immune response;  
T-lymphocytes proliferation; neonatal heart hypertrophy; tumour;  
cardiac insufficiency disorder; calcium flux; inflammation;  
vascular endothelial growth factor-stimulated proliferation;  
mamalian kidney mesangial cell proliferation; Berger disease;  
nephropathy; Schanlein-Henoch purpura; celiac disease; Crohn's disease;  
dermatitis herpetiformis; diabetes; haemoglobin switch; insulinaemia;  
pancreatic beta-cell precursor cell differentiation; thalassemias;  
obesity; auditory hair cell regeneration; hearing loss; bone disorder;  
cartilage disorder; sports injury; arthritis; PCR; primer; ss.

XX Homo sapiens.

XX
XX Novel isolated PRO polypeptides e.g. PRO1491 and PRO1571, useful in the
PT preparation of a medicament for treating a condition responsive to PRO
PT polypeptide, and as therapeutic agents e.g. vaccines.
XX
XX Example 34; Page 235; 561pp; English.
XX
XX The invention describes an isolated PRO (secreted and transmembrane)
CC polypeptide (I), having at least 80% sequence identity to a sequence
CC selected from any one of the 123 amino acid sequences given in

PR Novel isolated PRO polypeptides e.g. PRO1491 and PRO1571, useful in the  
PR preparation of a medicament for treating a condition responsive to PRO  
PR polypeptide, and as therapeutic agents e.g. vaccines.  
  
PR XX  
PR XX Example 34; SEQ ID NO 105; 555pp; English.  
PR XX  
PR CC The invention relates to human PRO polypeptides and the polynucleotides  
PR encoding them. The sequences are useful in the preparation of a  
PR medicament for treating a condition responsive to a PRO polypeptide. The  
PR polypeptides are useful in a number of functional biological assays, as  
PR molecular weight markers for protein electrophoresis and as therapeutic  
PR agents. The polynucleotides are useful as hybridisation probes for a cDNA

XX
XX New secreted and transmembrane PRO polypeptides useful for treating
PT cancers, kidney disorders, Crohn's disease, diabetes mellitus, hyper- or
PT hypo-insulinemia, sports injuries and arthritis.
PT
XX
XX Example 34; SEQ ID NO 105; 557bp; English.
PS
XX
XX The invention relates to an isolated PRO polypeptide (secreted or
CC transmembrane protein) having at least 80% amino acid sequence identity
CC to an amino acid sequence chosen from 123 fully defined sequences as
CC given in the specification (including their extracellular domains either
CC or without their associated signal peptides. Also include are the
CC nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a
CC host cell comprising the vector, producing PRO, a chimeric molecule
CC comprising PRO fused to a heterologous amino acid sequence, and an anti-
CC PRO antibody. Pro is useful as molecular weight markers for protein
CC electrophoresis and also for chromosome identification. PRO is also
CC useful for tissue typing. PRO and PRO NA are useful as hybridisation
CC probes for a cDNA library to isolate the full-length PRO cDNA. PRO NA is
CC useful for generating transgenic animals or knock-out animals which are
CC useful in development and screening useful reagents. PRO NA is also
CC useful in gene therapy. PRO1244, PRO1286 and PRO1303 polypeptides are
CC useful for treating cancerous tumours. PRO1250, PRO1418 and PRO1410
CC polypeptides are useful for suppressing immune response. PRO1246
CC polypeptide is useful for treating cardiac insufficiency disorder.
CC PRO1246 polypeptide is also useful for treating tumours. PRO1246 and
CC PRO1561 polypeptide are useful for stimulating calcium flux in human
CC umbilical vein endothelial cells. PRO1265, PRO1250 and PRO1474
CC polypeptides are useful for treating bone and/or cartilage disorders
CC (e.g., arthritis) and wound healing. PRO1130, PRO1275 and PRO1418
CC polypeptides are useful for treating diabetes in skeletal muscle cells
CC and obesity. PRO1265, PRO1244 and PRO1382 polypeptides are useful for
CC treating Berger disease or other nephropathies associated with Schonlein-
CC Henoch purpura, coeliac disease, dermatitis, herpiformis or Crohn's
CC disease. PRO1478, PRO1265, PRO1412, PRO1279, PRO1304, PRO1406, PRO1418,
CC PRO1410 and PRO1575 are useful in treating thalassemias. The present
CC sequence is a PCR primer used to isolate a cDNA encoding a PRO protein of

XX  
XX  
XX Novel isolated PRO polypeptide useful for tissue typing, modulating  
XX biological activity of cell, as molecular weight markers in protein  
XX electrophoresis, for treating arthritis, tumor.  
XX  
XX Example 34; SEQ ID NO 105; 549bp; English.  
XX  
XX The invention relates to an isolated PRO polypeptide (secreted or  
XX transmembrane protein) having at least 80% amino acid sequence identity  
XX  
XX  
XX Query Match 0.1%; Score 17.8; DB 1; Length 21;

```

Novel secreted and transmembrane PRO polypeptides useful in the preparation of a medicament for treating a condition responsive to PRO polypeptide and as therapeutic agents e.g. vaccines.

Example 34; SEQ ID NO 105; 555pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity

Query Match 0.1%; Score 17.8; DB 1; Length 21;

XX New PRO nucleic acid, useful for the manufacture of a medicament for  
 PT diagnosing or treating tumor or for tissue typing.

XX Example 34; SEQ ID NO 105; 558pp; English.

XX The invention relates to an isolated PRO polypeptide (secreted or  
 CC transmembrane protein) having at least 80% amino acid sequence identity  
 CC to an amino acid sequence chosen from 123 fully defined sequences as  
 CC given in the specification (including their extracellular domains either  
 CC or without their associated signal peptides. Also include are the  
 CC nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a  
 CC host cell comprising the vector, producing PRO, a chimeric molecule  
 CC comprising PRO fused to a heterologous amino acid sequence, and an anti-  
 CC PRO antibody. PRO is useful as molecular weight markers for protein  
 CC electrophoresis and also for chromosome identification. PRO is also  
 CC useful for tissue typing. PRO and PRO NA are useful as hybridisation  
 CC probes for a CDNA library to isolate the full-length PRO cDNA. PRO NA is

CC useful for generating transgenic animals or knock-out animals which are  
CC useful in development and screening useful reagents. PRO NA is also  
CC useful in gene therapy. PRO1244, PRO1286 and PRO1303 polypeptides are  
CC useful for treating cancerous tumours. PRO1250, PRO1418 and PRO1410  
CC polypeptides are useful for suppressing immune response. PRO1246  
CC polypeptide is useful for treating cardiac insufficiency disorders.  
CC PRO1561 polypeptide is also useful for treating tumours. PRO1246 and  
CC umbilical vein endothelial cells. PRO1265, PRO1250 and PRO1474  
CC polypeptides are useful for treating bone and/or cartilage disorders  
CC (e.g., arthritis) and wound healing. PRO1130, PRO1275 and PRO1418  
CC polypeptides are useful for treating diabetes in skeletal muscle cells  
CC and obesity. PRO1265, PRO1244 and PRO1382 polypeptides are useful for  
CC treating Berger disease or other nephropathies associated with Schonlein-  
CC Henoch purpura, coeliac disease, dermatitis, herpiformis or Crohn's  
CC disease. PRO1478, PRO1265, PRO1412, PRO1279, PRO1304, PRO1306, PRO1418,  
CC PRO1410 and PRO1575 are useful in treating thalassemias. The present  
CC sequence is a PCR primer used to isolate a cDNA encoding a PRO protein of  
CC the invention.

CC	CC The invention relates to a novel nucleic acid molecule encoding a tumour
CC	CC associated antigen. The tumour-associated antigen having a sequence of
CC	CC 639, 110, 241, 765, 948 or 210 amino acids given in the specification, or
CC	CC its functional equivalent; or hybridizes to the tumour-associated antigen
CC	CC under high stringing conditions. The tumour-associated antigen has
CC	CC cytostatic activity. The tumour-associated antigen protein and its
CC	CC fragments can be used to create a vaccine for the treatment of disorders.
CC	CC The nucleic acid encoding the tumour-associated antigen can be used in
CC	CC gene therapy to treat disorders. The tumour associated antigens, nucleic
CC	CC acids encoding them and compositions comprising them are useful for
CC	CC treating malignancies or tumors (e.g. lymphoma, leukaemia, or solid
CC	CC tumour). The method is useful for detecting a malignant cell/tumour-
CC	CC associated antigen profile of an individual suffering from a malignancy
CC	CC or tumour, or for determining a lymphoma-associated antigen profile of an

CC individual suffering from a lymphoma. The method of identifying malignant  
CC cells is useful for screening for minimal residual disease, recurrence of  
CC malignancy or tumour after treatment, or to monitor the progress of the  
CC treatment of an individual for a malignancy or tumour. This  
CC polynucleotide sequence represents a primer used in the exemplification  
CC of the invention.

XX
XX New isolated PRO polypeptide useful for tissue typing, modulating the
XX biological activity of a cell, as molecular weight markers in protein
XX electrophoresis, and for treating e.g. arthritis, or tumor.
XX
XX Example 34; SEQ ID NO 105; 551pp; English.
XX
XX The invention relates to an isolated PRO polypeptide (secreted or
XX transmembrane protein) having at least 80% amino acid sequence identity

XX
XX New isolated PRO polypeptides useful for treating diseases such as cancer
XX and diabetes.
XX
XX Example 34; SEQ ID NO 105; 551pp; English.
XX
XX The invention relates to an isolated PRO polypeptide (secreted or
XX transmembrane protein) having at least 80% amino acid sequence identity
XX to an amino acid sequence chosen from 123 fully defined sequences as
XX given in the specification (including their extracellular domains either
XX or without their associated signal peptides. Also include are the

 PT Novel isolated PRO polypeptide useful for treating tumor, kidney  
 PT disorders, diabetes mellitus, thalassemia.  
 XX  
 PS Example 34; SEQ ID NO 105, 552pp; English.  
 XX  
 CC The invention relates to an isolated PRO polypeptide (secreted or  
 CC transmembrane protein) having at least 80% amino acid sequence identity  
 CC to an amino acid sequence chosen from 123 fully defined sequences as  
 CC given in the specification (including their extracellular domains either  
 CC or without their associated signal peptides. Also include are the

PT New PRO polynucleotides and polypeptides, useful in promoting wound healing and in diagnosing and treating cancer, neurodegenerative diseases, stroke, hypertension or diabetes mellitus.

PS Example 34; SEQ ID NO 105; 550pp; English.  
....

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 123 fully defined sequences as given in the specification (including their extracellular domains either or without their associated signal peptides). Also include are the nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a host cell comprising the vector, producing PRO, a chimeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO is useful as molecular weight markers for protein electrophoresis and also for chromosome identification. PRO is also useful for tissue typing. PRO and PRO NA are useful as hybridisation probes for a cDNA library to isolate the full-length PRO cDNA. PRO NA is useful for generating transgenic animals or knock-out animals which are useful in development and screening useful readouts. PRO NA is also useful in gene therapy. PRO1244, PRO1286 and PRO1303 polypeptides are useful for treating cancersous tumours. PRO1250, PRO1418 and PRO1410 polypeptides are useful for suppressing immune response. PRO1246 polypeptide is useful for treating cardiac insufficiency disorders. PRO1246 polypeptide is also useful for treating tumours. PRO1246 and PRO1561 polypeptides are useful for stimulating calcium flux in human umbilical vein endothelial cells. PRO1265, PRO1250 and PRO1474 polypeptides are useful for treating bone and/or cartilage disorders (e.g., arthritis) and wound healing. PRO1130, PRO1275 and PRO1418 polypeptides are useful for treating diabetes in skeletal muscle cells and obesity. PRO1265, PRO1244 and PRO1382 polypeptides are useful for treating Berger disease or other nephropathies associated with Schönlein Henoch purpura, collagen disease, dermatitis, herpeticiformis or Crohn's disease. PRO1478, PRO1265, PRO1412, PRO1379, PRO1304, PRO1306, PRO1418, PRO1410 and PRO1575 are useful in treating thalassemias. The present sequence is a PCR primer used to isolate a cDNA encoding a PRO protein of the invention.

PT Trypsin family serine proteases expressed specifically in mature testis  
PT for development of methods for diagnosis and treatment of sterility and  
PT for contraception.

PS Example 9; Page 44; 121pp; Japanese

The invention relates to novel murine and human testis specific serine proteases (Tespesc PRO; AAB03156-B03160) and to cDNAs encoding them (AAA61558-661562). It also encompasses expression vectors and host cells comprising a nucleotide sequence encoding a protease of the invention, inhibitors of the proteases and antibodies against the proteases. The novel proteases are members of the trypsin family of serine proteases, having the serine and histidine active site signatures characteristic of this family. The proteases are specifically expressed in mature testis and participate in the differentiation and maturation of sperm. The proteases are potentially useful for the development of pharmaceuticals for the treatment of male infertility and other male reproductive disorders, and for the development of contraceptives. They may also be used as reagents for the diagnosis of male infertility. Sequences AAA61558-66158 represent murine Tespesc PRO-1 reverse transcription-PCR (RT-PCR) primers used in the isolation of cDNA encoding human Tespesc PRO-3 (AAA61561).

PT sequence and antisense sequence which has specific modifications.
XX Example 5; SEQ ID NO 999; 378bp; English.
PS
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of a disorder characterised by elevated or
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control Apob gene expression.

XX (ALNY-) ALANYLAM PHARM.

XX Manoharan M, Bumcrot D;

XX WPI; 2004-677362/66.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
XX sense sequence and an antisense sequence, where the sense sequences have  
XX one or more asymmetrical 2'-O alkyl modifications, the antisense  
XX sequences have one or more asymmetrical phosphorothioate modifications  
XX and the antisense sequence targets a human gene sequence. Also described  
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
XX levels or glucose-6-phosphatase levels in a subject; producing (I);  
XX stabilising (I), involves selecting a sequence with activity and  
XX introducing one or more asymmetrical modification in the sequence, where  
XX the modification decreases nuclease sensitivity while not decreasing its  
XX activity; a kit comprising (I) and instruction for its use; and a device  
XX that can be dispense or administer a composition comprising (I). (I) is  
XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
XX The subject is suffering from a disorder characterised by elevated or  
XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The  
XX disorder is chosen from the HDL/LDL cholesterol imbalance, the  
XX dyslipidaemias, hypercholesterolaemia, statin-resistant  
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to  
XX inhibit hepatic glucose production or for treating glucose-metabolism-  
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or  
XX lung cancer), neurological disease (e.g., Huntington disease or  
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
XX represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
XX can be used to control Apob gene expression.

XX Example 5; SEQ ID NO 400; 378bp; English.

CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
CC sense sequence and an antisense sequence, where the sense sequences have  
CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
CC sequences have one or more asymmetrical phosphorothioate modifications  
CC and the antisense sequence targets a human gene sequence. Also described  
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
CC levels or glucose-6-phosphatase levels in a subject; producing (I);

 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance, the  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

PT Interference RNA agent useful for treating dyslipidaemia, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

PS Example 5; SEQ ID NO 4379; 378bp; English.

XX The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O-alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemia, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or

 PS Example 5; SEQ ID NO 390; 378bp; English.  
 CC The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemia, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 PT Interference RNA agent useful for treating dyslipidemia, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 330; 378bp; English.  
 CC The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant,  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorders e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX Interference RNA agent useful for treating dyslipidaemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprising sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 2665; 378bp; English.

CC The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 CC levels or glucose-6-phosphate levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphate levels. (M)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphate levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant,  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX Example 5; SEQ ID NO 846; 378bp; English.
XX
PS The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I); involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterized by elevated or
CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control ApoB gene expression.

 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 2664; 378bp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

XX Interference RNA agent useful for treating dyslipidemias, coronary artery

PT disease, diabetes, cancer or neurological disease, comprises sense

PT sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 21; 378bp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a

CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity, a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemiae, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (Apob) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 3616; 378bp; English.  
 XX  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or

XX
XX  Interference RNA agent useful for treating dyslipidemias, coronary artery
XX  disease, diabetes, cancer or neurological disease, comprises sense
XX  sequence and antisense sequence which has specific modifications.
XX
XX  Example 5; SEQ ID NO 2948; 378bp; English.
XX
XX  The invention describes a RNA interference (iRNA) agent (I) comprising a
XX  sense sequence and an antisense sequence, where the sense sequences have
XX  one or more asymmetrical 2'-O alkyl modifications, the antisense
XX  sequences have one or more asymmetrical phosphorothioate modifications
XX  and the antisense sequence targets a human gene sequence. Also described
XX  are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100
XX  levels or glucose-6-phosphatase levels in a subject; producing (I);
XX  establishing (I), involves selecting a sequence with activity and
XX  introducing one or more asymmetrical modification in the sequence, where
XX  the modification decreases nuclease sensitivity while not decreasing its
XX  activity; a kit comprising (I) and instruction for its use; and a device
XX  that can be dispense or administer a composition comprising (I). (I) is
XX  useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)

```

```

CC  is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
CC  The subject is suffering from a disorder characterised by elevated or
CC  otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC  levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC  disorder is chosen from the HDL/LDL cholesterol imbalance,
CC  dyslipidemias, hypercholesterolaemia, statin-resistant
CC  hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC  disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC  inhibit hepatic glucose production or for treating glucose-metabolism-
CC  related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC  treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC  lung cancer), neurological disease (e.g., Huntington disease or
CC  spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC  represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC  can be used to control ApoB gene expression.

XX PT Constructing strains for identifying gene products as effective targets  
XX for therapeutic intervention, by inactivating in the strain one allele of  
XX a gene and placing other allele of the gene under conditional expression.

XX PS Claim 36; SEQ ID NO 5708; 167bp + Sequence Listing; English.

XX CC The invention relates to constructing (M1) a strain of diploid fungal  
XX cells in which both alleles of a gene are modified, comprising modifying  
XX one allele by insertion or replacement by a cassette having an  
XX expressible selectable marker and modifying other allele by  
XX recombination, of a promoter replacement fragment with a heterologous  
XX promoter, so that expression of the second allele is regulated by the  
XX promoter. (M1) is useful for constructing a strain of diploid fungal  
XX cells in which both alleles of a gene are modified. The diploid fungal  
XX cells having both alleles modified are useful for identifying a gene that  
XX is essential to the survival or growth of a fungus, a gene that  
XX contributes to the virulence and/or pathogenicity of a fungus, a gene  
XX that contributes to the resistance of a diploid fungus to an antifungal  
XX agent, an antifungal agent that inhibits the growth of a diploid fungus  
XX and for identifying a therapeutic agent for treatment of a mammalian  
XX disease. (M1) is useful for identifying a compound which modulates the  
XX activity of a gene product, preferably enzymatic activity, carbon  
XX compound catabolism, biosynthetic, transporter, transcriptional,  
XX translational, signal transduction, DNA replication and cell division  
XX activity. The method is useful for identifying a compound having the  
XX ability to inhibit growth or proliferation of C. albicans cells and for  
XX treating infection by C. albicans. The present sequence is that of a PCR  
XX primer used in the method of the invention. Note: The sequence data for  
XX this patent is not represented in the printed specification but is based  
XX on sequence information supplied to Derwent by the European Patent Office

CC This invention describes a novel composition (a) a first active agent,  
CC comprising oligonucleotides, effective for alleviating  
CC bronchoconstriction, respiratory tract inflammation, allergies and  
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
CC surfactant depletion or hyposecretion, when administered to a mammal. The  
CC oligonucleotides are derived from a gene encoding or regulating  
CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)  
CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
CC analgesic, hypotensive, immunosuppressive and cyostatic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

CC prevent any unwanted effects due to it

XX New compounds targeted to nucleic acid molecules encoding AP-2 alpha and

PT inhibits the expression of AP-2 alpha, useful for treating AP-2 alpha-

PT associated disease or condition, particularly a hyperproliferative

PT disorder.  
XX Example 15; SEQ ID NO 46; 58pp; English.

XX The invention describes a compound (I) 8-80 nucleobases in length

CC targeted to a nucleic acid molecule encoding AP-2 alpha. The compound

CC specifically hybridizes with a nucleic acid molecule encoding AP-2 alpha

CC (19868 bp, SEQ ID NO: 4), and inhibits the expression of AP-2 alpha. Also

CC described are: inhibiting the expression of AP-2 alpha in cells or tissues

CC comprising contacting the cells or tissues with (I); screening for a

CC modulator of AP-2 alpha by contacting a preferred target segment of a

CC nucleic acid molecule encoding AP-2 alpha with one or more candidate

CC modulators of AP-2 alpha, and identifying one or more modulators of AP-2

CC alpha expression, which modulate the expression of AP-2 alpha; a

CC diagnostic method for identifying a disease state; and a kit or assay

CC device comprising (I). The compound is useful for treating an animal

CC having a disease or condition associated with AP-2 alpha, particularly a

CC hyperproliferative disorder. The compounds may be used for diagnostics,

CC therapeutic prophylaxis and as research reagents; or as tools in

CC differential and/or combinatorial analyses to elucidate expression

CC patterns of a portion or the entire complement of genes expressed within

CC cells and tissues. This sequence represents a human transcription factor  
XX AP-2 antisense oligonucleotide.

XX New single stranded oligonucleotides comprising a DNA domain having at
PT least one mismatch with respect to the genetic sequence of the
FT Huntington's disease gene to be altered, useful for treating or
XX preventing Huntington's disease.
XX
XX Example 1; Fig 6b; 133pp; English.
PS
XX
XX The present sequence is that of a portion of a mutated glutamine (CAG)
CC triplet repeat region of exon 1 of the human Huntington's disease (HD)
CC gene (see also AB281760). The triplet repeat region (see AB281767) is
CC mutated following treatment with an RNA/DNA chimeric oligonucleotide (see
CC AB281768) that causes a CAG (Gln) to TAG (stop) gene alteration in the HD
CC exon 1 repeats due to sliding of the repeat region, a phenomenon that can
CC occur with the methods of this invention. The RNA/DNA chimeric
CC oligonucleotide is an example of oligonucleotides of the invention for
CC targeted alteration of the HD gene. Such oligonucleotides can be used for
CC the treatment or prevention of HD

PS
XX
XX This invention relates to a novel method for the diagnosis of greater
CC susceptibility to gastric carcinoma, comprising searching for a possible
CC polymorphism in the promoter of the epithelial cadherine (E-cadherine)
CC gene. The method is useful for identifying a genetic polymorphism that
CC leads to a greater predisposition to the onset of gastric carcinoma. The
CC method is relatively simple, quick, accurate and reliable. The present
CC sequence is that of E-cadherine PCR primer 2 (from primer pair A) used
CC during a method to identify the genotype of an individual for a C to A
CC polymorphism at nucleotide -160 of the E-cadherine gene and claimed in
CC claim 11 of the specification

 XX Nucleic acid encoding mutated form of human dual-specificity phosphatase  
 PT CDC14A polypeptide, useful to diagnose and treat cancers.  
 XX  
 PS Example 1; Col 40; 41pp; English.  
 XX  
 CC The invention relates to an isolated nucleic acid encoding a CDC14A  
 CC polypeptide (cell-cycle control protein 14A, a dual specificity  
 CC phosphatase), its complement or RNA molecule corresponding to it. Also  
 CC included are an expression vector comprising the nucleic acid and a host

CC cell transformed with the vector. The gene for CDC14A is located on human  
 CC chromosome 1p21. The nucleic acid and protein are useful to diagnose and  
 CC treat human cancers (e.g. breast cancer, prostate cancer) and tumours  
 CC (e.g. lymph node metastasis, malignant mesothelioma) which have a  
 CC mutation in the CDC14A gene, by gene therapy, protein replacement therapy  
 CC or protein mimetics. They can also be used to screen for drugs to treat  
 CC cancer. The present sequence is a PCR primer used to amplify CDC14A  
 CC sequences

 XX Endocrine cell lines originated from mammalian hypothalamus and  
 PT pancreatic islet, applicable in expression cloning systems of bioactive  
 PT peptide precursor genes, and in screening G protein-coupled receptor  
 PT ligands.  
 XX  
 PS Example 6; SEQ ID NO 13; 316pp; Japanese.  
 XX  
 CC This invention relates to a novel method for obtaining a DNA that encodes  
 CC a peptide acting as agonist, antagonist or inverse agonist on a target  
 CC receptor. Specifically, it comprises transformation of endocrine cell  
 CC lines originating from mammalian hypothalamus and pancreatic islets,  
 CC culturing the transformants and contacting with cells expressing the  
 CC target receptor. The identification of those cells with a response  
 CC reaction can be used for selecting a transformant cell line with the  
 CC appropriate target activity that is expressing the novel transformed DNA.  
 CC Accordingly, the present invention describes novel cell lines that are  
 CC applicable in expression cloning systems of bioactive peptide precursor  
 CC genes, and in screening GPCR ligands for use as drugs including agonists,  
 CC antagonists and inverse agonists i.e. activators and inhibitors. Such  
 CC cell lines can provide a highly sensitive and convenient GPCR ligand  
 CC assay system. This oligonucleotide sequence is a PCR primer used to  
 CC amplify cDNA to transform endocrine cell lines of the invention.

 PT Screening agonist or antagonist of G-protein coupled receptor-T4  
 PT polypeptide, by contacting GPCR-T4 with ligand e.g. thyroxine and test  
 PT substance, measuring amount of ligand binding to GPCR-T4 and comparing  
 PT result to control.  
 PS  
 PS Example 9; SEQ ID NO 22; 114bp; Japanese.  
 XX  
 XX The invention relates to a novel method for screening an agonist or  
 CC antagonist of G-protein coupled receptor (GPCR)-T4 polypeptide. The  
 CC method comprises contacting GPCR-T4, its salt, cells expressing GPCR-T4  
 CC or a membrane fraction of the cell with a ligand chosen from thyroxine,  
 CC isocanazole, a compound of formula I or II (described in the  
 CC specification), its derivative or salt, and test substance, and measuring  
 CC the amount of the ligand binding to GPCR-T4. The invention further  
 CC comprises a method for screening a substance which controls the activity  
 CC of thyroid gland function, activates or inhibits neutrophils, and  
 CC prevents or treats inflammatory diseases, asthma, chronic obstructive  
 CC pulmonary disease or infectious disease; a method for screening a  
 CC substance which controls the activity of thyroid gland function,  
 CC activates or inhibits neutrophils, and prevents or treats inflammatory  
 CC diseases, asthma, chronic obstructive pulmonary disease or infectious  
 CC disease; a kit for screening an agonist or antagonist of the GPCR-T4  
 CC polypeptide; a method for screening a substance which controls the  
 CC expression level of a gene encoding the GPCR-T4 polypeptide; an agent for  
 CC controlling thyroid gland function, activation or inhibition of  
 CC neutrophil, and prevention or treatment of inflammatory diseases, asthma,  
 CC chronic obstructive pulmonary disease or infectious diseases, and  
 CC determining the abnormality in thyroid gland function, activation or  
 CC inhibition of neutrophil, and inflammatory diseases, asthma, chronic  
 CC obstructive pulmonary disease or infectious disease. The GPCR-T4

CC polypeptide agonist or antagonist have the following activities:  
 CC antiasthmatic, antinflammatory, antimicrobial, and antithyroid. The  
 CC invention provides a novel method which is useful for screening an  
 CC agonist or antagonist of G-protein coupled receptor (GPCR)-T4  
 CC polypeptide. The invention provides a further method useful for screening  
 CC a substance which controls the activity of thyroid gland function,  
 CC activates or inhibits neutrophils, and prevents or treats inflammatory  
 CC diseases, asthma, chronic obstructive pulmonary disease or infectious  
 CC disease. This polynucleotide sequence represents a primer used in the  
 CC exemplification of the invention.

 PS Claim 6; Page 51; 72pp; English.  
 XX  
 XX The invention relates to a substantially purified or isolated nucleic  
 CC acid (I) from ryegrass or fescue species including a simple sequence  
 CC repeat (SSR), having 2 or more tandemly repeated nucleotide core elements  
 CC 2-6 nucleotides in length. Also included are a nucleic acid primer  
 CC suitable for amplifying an SSR, identifying (M1) an SSR by preparing a  
 CC library of ryegrass or fescue genomic DNA enriched for SSRs and  
 CC identifying clones in the library containing SSRs, a library of ryegrass  
 CC or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for  
 CC a gene in grass or cereal breeding by identifying an SSR that is closely  
 CC associated with the gene such that the SSR and the gene are

CC preferentially co-inherited, and selecting for the SSR in the breeding, a  
 CC method for DNA profiling grass or cereal species varieties by assessing  
 CC variation between SSR varieties and testing the purity of grass or cereal  
 CC seed batches by assessing variation within seed batch of an SSR. The SSRs  
 CC may be used in the selection of genes in grass or cereal breeding, for  
 CC profiling grass or cereal species varieties, for testing the purity of  
 CC grass or cereal seed batches, and for DNA profiling to establish the  
 CC distinct identity, uniformity and/or stability of a cultivar. The present  
 CC sequence is a ryegrass or fescue SSR

 PT Constructing synthetic polynucleotide for modulating the quality of a  
 PT selected phenotype displayed by an organism comprises replacing a first  
 PT codon with a synonymous codon to construct the synthetic polynucleotide.  
 XX  
 PS Example 1; SEQ ID NO 31; 86pp; English.  
 XX  
 CC The present invention describes a method for constructing a synthetic  
 CC polynucleotide from which a polypeptide is producible to confer a  
 CC selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. The method comprises: (a) selecting a first codon of  
 CC the parent polynucleotide for replacement with a synonymous codon, where  
 CC the synonymous codon is selected on the basis that it exhibits a  
 CC different phenotypic preference than the first codon in a comparison of  
 CC phenotypic preferences in test organisms or parts, where the test  
 CC organism are selected from organisms of the same species as the organism  
 CC of interest and organisms that are related to the organisms of interest;  
 CC and (b) replacing the first codon with the synonymous codon to construct  
 CC the synthetic polynucleotide. Also described: (1) a method for  
 CC determining the phenotypic preference of a first codon in an organism of  
 CC interest or its parts; (2) a synthetic polynucleotide constructed from  
 CC the method above; (3) an organism or interest or part containing a  
 CC synthetic polynucleotide constructed from the method above; (4) an

CC organism or interest or part containing a synthetic construct that  
 CC comprises a regulatory polynucleotide operably linked to a tandem repeat  
 CC of a first codon fused in frame with a reporter polynucleotide that  
 CC encodes a reporter protein, which produces, or is predicted to produce a  
 CC selected phenotype or a phenotype of the same class as the selected  
 CC phenotype in the organism or part; (5) a method of modulating the quality  
 CC of a selected phenotype that is displayed by an organism of interest or  
 CC part and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; (6) a method of enhancing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; and (7) a method of reducing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide. The method is useful for constructing a  
 CC synthetic polynucleotide from which a polypeptide is producible to confer  
 CC a selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. It is useful for modulating the quality of a selected  
 CC phenotype displayed by an organism or part. The present sequence encodes  
 CC a synthetic leader sequence, which is used in an example from the present  
 CC invention.

XX
XX The present invention describes a method of arraying genome clones. The
XX method comprises: (a) clones of the genomic libraries contained in
XX multiwell plates numbered for discrimination are mixed in each of the
XX multiwell plates; (b) a primer designed based on the chromosome marker
XX sequence is added to the mixture to carry out an amplification reaction;
XX (c) a signal corresponding to the marker is detected from the resultant
XX amplified product to specify the discrimination Nos. of the multiwell
XX plates containing the clones having said marker sequence; (d) the order
XX of the markers is changed so that the same discrimination Nos. succeed to
XX the maximum in the specified discrimination Nos. to array the multiwell
XX plates; (e) the clones in the multiwell plates of the specified
XX discrimination Nos. are mixed respectively in each well of longitudinal
XX and lateral directions; (f) the mixed clones are cultured and the
XX resultant cultures are amplified by using the above primer; (g) signals
XX are detected from the amplified products; (h) the clones in the multiwell
XX plates are specified from the detected result; and (i) the clones are
XX reconstituted as the positions on the chromosome and arrayed. The
XX microarray is useful for gene analysis. ABL42957 to ABL45322 represent

XX
XX New oligonucleotide having a sequence complementary to a sequence of
XX ribonucleic acid encoding a heparanase, useful for preparing a
XX composition for treating tumor.
XX
XX Claim 7; Page 32; 48pp; English.
XX
XX The present invention describes an oligonucleotide having a sequence
XX complementary to a sequence of ribonucleic acid encoding a heparanase.
XX The oligonucleotide hybridises with the ribonucleic acid under conditions
XX of high stringency and has a sequence comprising 10-40 bp. The
XX internucleoside linkages of the oligonucleotide comprise at least one
XX phosphorothioate linkage. Hybridisation of the oligonucleotide to the
XX ribonucleic acid inhibits expression of the heparanase, where inhibition
XX of heparanase means at least a 50% reduction in the quality of
XX heparanase. Also described: (1) a method of inhibiting expression of a
XX oligonucleotide in an amount effective to inhibit the expression of a
XX heparanase in the cell and a carrier; and (3) a method of treating a
XX tumour in a subject comprising administering to the subject an amount of
XX the above oligonucleotide effective to inhibit expression of a heparanase
XX in the subject. Heparanase antisense oligonucleotides have cytostatic
XX activity, can be used in gene therapy, and can be used for preparing a
XX composition for treating tumours. The present sequence represents a human
XX heparanase phosphorothioate antisense oligonucleotide, which is used in
XX the exemplification of the present invention

XX
XX The invention relates to a novel antisense compound targeted to a nucleic
XX acid molecule encoding human apolipoprotein B (Apob) which specifically
XX hybridises with and inhibits the expression of human apolipoprotein B.
XX The compound of the invention demonstrates antiarteriosclerotic,
XX cardiant, antidiabetic and anorectic activities and may be useful for
XX preparing a composition for treating abnormal lipid or cholesterol
XX metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or
XX cardiovascular disease. Furthermore, the compound has gene therapy
XX applications. The current sequence is that of the 2'-O-methoxyethyl (2'-
XX MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a
XX phosphorothioate backbone throughout and in which all cytidine residues
XX are 5-methylcytidines.

 PT New antisense compound targeted to a nucleic acid molecule encoding  
 PT Nav1.3, useful for useful for treating a disease or condition associated  
 PT with Nav1.3, e.g. pain, seizure disorder such as childhood seizure  
 PT disorder, or ataxia.  
 XX  
 PS Claim 4; SEQ ID NO 994; 417bp; English.  
 CC The present invention relates to an antisense compound targeted to a  
 CC nucleic acid molecule encoding Nav1.3, where the antisense compound  
 CC specifically hybridizes with and inhibits the expression of Nav1.3. The  
 CC compound and composition are useful for treating a disease or condition  
 CC associated with Nav1.3, e.g. pain including but not limited to

CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,  
 CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,  
 CC pain from burns, migraine headache, cluster headache, mild-to-moderate  
 CC headache; seizure disorder such as childhood seizure disorder, including  
 CC but not limited to neonatal or infantile epilepsy; or ataxia. The present  
 CC sequence represents a chimeric phosphorothioate oligonucleotide with  
 CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of  
 CC human Nav1.3 expression, the oligonucleotides are designed to target  
 CC different regions of the human Nav1.3 RNA.

XX      confluent HepG2 cells in culture at a concentration of 150 nM. The
XX      compound of the invention demonstrates cardiovascular,
XX      antiarteriosclerotic, antidiabetic, antidiabetic, anorectic, cardiant,
XX      vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX      endocrine, vasotropic, neuroprotective and noctropic activities and may
XX      be useful for inhibiting the expression of apolipoprotein B in cells or
XX      tissues in vivo in order to address a condition associated with abnormal
XX      lipid or cholesterol metabolism. The compound may be useful for
XX      decreasing circulating lipoprotein levels, triglyceride levels,
XX      cholesterol levels, lipid levels, fatty acid levels, acute phase
XX      reactants and chylomicrons and thus may be utilised during treatment of
XX      hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX      cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's
XX      syndrome, sexual ateliotic dwarfism, hypertyroidism, hypertension,
XX      anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,

XX
XX      The present invention describes a method (M1) for the rapid breeding of
XX      improved plant varieties having desired properties/characteristics
XX      introduced in them. (M1) involves: (a) crossing a subject plant variety
XX      with another plant variety having the desired characteristic; (b) typing
XX      the genotype of the chromosome of the post-crossing generation in the
XX      young plant stage with the use of a single nucleotide polymorphism (SNP)
XX      marker; (c) selecting an individual to be used in the crossing in the
XX      next generation based on the typed genotype; (d) back-crossing the
XX      selected individual with the subject plant variety as described above;
XX      and (e) repeating steps (b)-(d) at least 3 times. Also described: (1) an
XX      improved plant variety produced by (M1); and (2) an improved rice breed
XX      from IR24. (M1) is useful for the rapid breeding of improved plant
XX      varieties having desired properties introduced in them. The subject plant
XX      variety is rice, more specifically Koshihikari rice. The improved plant
XX      variety produced by (M1) has favourable taste, a stable yield and better
XX      quality. The improved plant variety is not grown based on gene
XX      recombination, and so it is safe for consuming. The present sequence

PT Activated mutant protein tyrosine kinases (e.g. NTRK3, FES and MCKK) and  
XX associated methods for diagnosing cancer and screening for anti-cancer  
XX agents.

PS Disclosure; SEQ ID NO 1075; 363pp; English.

XX This invention relates to a novel activated mutant protein tyrosine  
XX kinases and associated methods for diagnosing cancer and screening for  
XX anti-cancer agents. Protein kinases are signalling molecules involved in  
XX tumorigenesis. Mutational analysis of the human tyrosine kinase gene  
XX family identified somatic alteration sin 1 in 5 colorectal cancers, with  
XX the majority of mutations occurring in the NTRK3, FES, GUCY2F and  
XX MCKK/MLK4 genes. Most were identified in the kinase domain. The invention  
XX may be useful for the production of compounds with a cytosolic activity  
XX acting as protein tyrosine kinase inhibitors or granulate cyclase  
XX stimulators. The invention may be useful for developing methods for  
XX detecting mutations involved in cancer or screening for anti-cancer  
XX agents. The present sequence is that of a human-derived oligonucleotide  
XX which is related to the invention.

XX Inhibiting the proliferation or survival of breast cancer or leukemic
XX cells, for treating breast cancer, leukemia, by contacting the cancer
XX cells with an agent that inhibits the Wnt/Fzd signaling pathway in the
XX cancer cells.
XX
XX Claim 133; Fig 13A; 156pp; English.
XX
XX The invention relates to a novel method for inhibiting the proliferation
XX or survival of breast cancer cells that overexpress a Wnt (wingless)
XX protein in a Wnt/Fzd (fritzzled) signaling pathway when compared to non-
XX cancer cells and where the Wnt protein is selected from Wnt7b, Wnt-10b
XX and Wnt-14. The method comprises contacting the cancer cells with an
XX agent that inhibits the Wnt/Fzd signaling pathway in the cancer cells.
XX The method of the invention has cytostatic applications and may be useful
XX for treating a patient with breast cancer, chronic lymphocytic leukemia
XX or mantle zone lymphoma. The current sequence is that of a real-time PCR
XX primer of the invention which was used to amplify a human Fzd (fritzzled)
XX cDNA.

XX
XX AAT28317-T28347 represent multi-G oligonucleotides. AAT28325-T28331 are
XX based on various permutations of human c-myc sequence. These sequences
XX are oligonucleotides of the invention. These sequences can be modified to
XX become more nuclease resistant, using phosphorothioate,
XX phosphorodithioate, or 3'-carbon modified links. To screen for modified
XX multi-G sequences that inhibit cell proliferation, cultured smooth muscle
XX cells that are arrested in the G0 phase, are induced to proliferate in
XX the presence of the multi-G sequence. The cultured smooth muscle cells
XX used in this method are attached to a solid support, and growth arrest is
XX achieved on a starvation medium, followed by transfer to a normal growth
XX medium to induce proliferation. The compounds that provide over 50%
XX inhibition at a set dosage are selected as being useful for inhibiting
XX vascular restenosis. The multi-G oligonucleotides are used to inhibit
XX proliferation of smooth muscle cells, such as to prevent arterial
XX restenosis. These sequences are not antisense sequences, but are thought
XX to work in a similar way. The sequences are thought to act by binding to
XX proteins involved in the proliferation process. Compounds containing
XX these multi-G oligonucleotides are not toxic, and their effect on cell
XX proliferation is fully reversible

XX The present invention describes an antisense compound (I) of up to 30  
 CC nucleobases in length capable of inhibiting the expression of human  
 CC Smad7. (I) has antiinflammatory and cytostatic, and is a modulator of  
 CC Smad7 expression. (I) can be useful for inhibiting the expression of  
 CC human Smad7 in human cells or tissues, in vitro. (I) is commonly used as  
 CC a research reagent and in diagnostics for example, to elucidate the  
 CC function of particular genes. (I) is also useful for distinguishing  
 CC between functions of various members of a biological pathway and for  
 CC prophylaxis and in kits. (I) is also useful prophylactically, e.g. to  
 CC prevent or delay infection, inflammation or tumour formation. AAF2667 to  
 CC AAF26706 represent human Smad7 antisense oligonucleotides from the  
 CC present invention

XX Identifying agonists of GABA(B) receptors, useful for treating epilepsy  
PT and certain pain syndromes, comprises determining that the substance is  
PT not an agonist of GABA(B) receptors with gb-1b or gb-1c subunits.  
XX  
XX  
XX Example 7; Page 79; 142pp; English.  
PS  
XX  
XX The present invention describes a method for identifying gb-1a subtype-  
CC specific agonists of the gamma-amino-butyric acid B (GABA-B) receptor,  
CC comprising determining the substance is an agonist of GABA-B receptors  
CC with a gb-1a subunit, and is not an agonist of GABA-B receptors  
CC comprising gb-1b of gb-1c subunits. The method can be used for  
CC identifying agonists of GABA-B receptors which are heteromers of gb-1a  
CC and gb2 subunits. The substances are useful for treating conditions such  
CC as epilepsy, and pain syndromes. The method identifies substances that  
CC are not agonists of GABA-A receptors, which exhibit more selectivity for  
CC effector pathways and distinct mechanisms of action compared to other  
CC compounds such as baclofen. The present sequence represents a GABA-B  
CC receptor 1a (gb1a) antisense oligonucleotide, which is used in an example  
CC from the present invention

 PT Treating autoimmune disease by administering to subject having or at risk  
 PT of developing autoimmune disease, inhibitory nucleic acid and small  
 PT molecule antagonist of immunostimulatory CpG nucleic acids.  
 XX  
 PS Claim 9; Page 55; Opp; English.

CC The present invention relates to a method of treating an autoimmune  
 CC disease, which involves administering to a subject having or at risk of  
 CC developing an autoimmune disease an inhibitory nucleic acid and a small  
 CC molecule antagonist of immunostimulatory CpG nucleic acids, in an  
 CC effective amount to treat or prevent the autoimmune disease. The method  
 CC is useful for prophylaxis and treatment of autoimmune diseases, e.g.  
 CC rheumatoid arthritis, systemic lupus erythematosus (SLE), inflammatory  
 CC bowel disease, multiple sclerosis (MS), glomerulonephritis, type 1  
 CC diabetes mellitus, Sjogren's syndrome, viral infections associated with  
 CC hepatitis B virus (HBV) and hepatitis C virus (HCV), graft-versus-host  
 CC disease (GVHD), paraneoplastic autoimmune syndrome associated with small  
 CC cell lung cancer, and breast cancer. The present sequence is an  
 CC inhibitory nucleic acid shown in the exemplification of the invention

XX The invention relates to compositions, kits and methods for detecting  
CC polynucleotide sequence differences. The method involves amplifying the  
CC polynucleotide of interest in the presence of a labelled nucleotide and  
CC detecting variation based on incorporation frequency of labelled  
CC nucleotide compared to known reference frequency. The method is useful  
CC for determining a sequence difference such as a single nucleotide  
CC polymorphism (SNP) or a tandem repeat, between a region of interest in a  
CC polynucleotide and a reference sequence. It is useful for determining the  
CC presence of a mutation in a region of interest in a polynucleotide and is  
CC also useful for genotyping. The present sequence is an allelic  
CC oligonucleotide used in polynucleotide sequence detection.

CC The present sequence is a PCR primer (nt 66-84) for the human  
 CC steroidogenesis acute regulatory protein (hscAR) cDNA. The hscAR gene can  
 CC be analysed for mutations to detect (e.g. prenatally) genetic defects  
 CC associated with congenital lipid adrenal hyperplasia (CAH), or its  
 CC transmission to children. CAH can be treated by protein or gene  
 CC replacement therapy, which can also be used to prevent or treat  
 CC hypercholesterolaemia. A human adrenal cortex cDNA library was screened  
 CC with a mouse STAR probe to isolate a 1.6 kb insert, including an ORF for  
 CC a 285 residue protein. When it was cloned into pSPORT and expressed in  
 CC COS-1 cells cotransfected with pP450sc abd pADX, it increased the level  
 CC of pregnenolone synthesis from cholesterol or 20-alpha-hydroxycholesterol

PT Treatment of airway diseases such as asthma - by topically applying  
 PT adenosine-free antisense oligonucleotide to airway epithelium of  
 PT subject.  
 PT  
 XX

PS Claim 5; Page 28; 71pp; English.  
 XX

CC A method for treating airway disease in a subject has been produced,  
 CC which involves the topical administration of an essentially adenosine  
 CC free antisense oligonucleotide (ON) to the airway epithelium of the  
 CC subject. The present sequence is an antisense oligonucleotide  
 CC HMEELAM1AAS1 specific for the human endothelial leukocyte adhesion  
 CC molecule (ELAM-1). The method can be used to treat airway diseases  
 CC as cystic fibrosis, asthma, chronic obstructive pulmonary disease,  
 CC bronchitis and other airway diseases characterised by an inflammatory  
 CC response. By eliminating adenosine from the antisense ON, its liberation  
 CC upon antisense degradation is prevented, thereby preventing adenosine-  
 CC induced bronchoconstriction in patients with hyper-reactive airways

 PT vasoconstriction.  
 PT  
 PS Disclosure; Page 47; 120pp; English.  
 XX  
 CC The specification describes antisense oligonucleotides (AAV52869-X55271)  
 CC directed against at least 2 mRNAs selected from target genes, coding and  
 CC non-coding regions of RNAs corresponding to target genes, gene initiation  
 CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-  
 CC -end and the juxta-section between coding and non-coding regions and all  
 CC segments of RNAs encoding proteins associated with one or more diseases,  
 CC conditions or mixtures. The antisense oligonucleotides may be derived  
 CC from sequences AAX55272-74. These multiple target oligonucleotides  
 CC (specifically AAX55180-271) can be used for the antisense treatment of  
 CC diseases and conditions. Typical diseases and conditions are those  
 CC associated with impaired respiration and inflammation, including lung  
 CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,  
 CC acute asthma, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,  
 CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary  
 CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.  
 CC colon cancer, breast cancer, lung cancer, pancreatic cancer,  
 CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as  
 CC well as all types of cancers which may metastasize or have metastasized  
 CC to the lungs, including breast and prostate cancer

 PT New antisense oligonucleotides useful for treating e.g. pulmonary  
 PT vasoconstriction, inflammation, allergies, asthma, hypertension,  
 PT bronchitis, emphysema, respiratory distress syndrome, ischemia or  
 PT cancers.  
 PT  
 PS Claim 18; Page 401; 1343pp; English.  
 XX  
 CC The present invention describes a new composition comprising an antisense  
 CC oligonucleotide (ON) with low adenosine (up to 15%), which targets  
 CC nucleic acids involved in bronchoconstriction, allergies, and/or  
 CC inflammation. The ON can have antiinflammatory, antiallergic,  
 CC antiaesthetic, cytostatic and analgesic activities. The compositions are  
 CC useful for the treatment of diseases associated with inflammation,  
 CC impaired airways, including lung disease and diseases whose secondary  
 CC effects afflict the lungs of a subject. They can be used for treating  
 CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,  
 CC impeded respiration, respiratory distress syndrome, pain, cystic  
 CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive  
 CC pulmonary disease (COPD), and cancers such as leukemias, lymphomas,  
 CC carcinomas, and cancers which may metastasize to the lungs, including  
 CC breast and prostate cancer. The reduction of the adenosine content of the  
 CC ON reduces side effects. The A-containing ONs break down with the  
 CC release of deoxyadenosine which activates adenosine receptors causing  
 CC bronchoconstriction and inflammation. AAAA23313 to AAAA35312 represent the  
 CC nucleotide sequences given in the sequence listing from the present  
 CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185  
 CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ  
 CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAAA23323 to  
 CC AAAA33992) are specifically claimed ONs from the present invention. N.B.  
 CC Sequences given in the disclosure of the present invention do not match  
 CC up with their corresponding SEQ ID NO: sequences given in the sequence  
 CC listing

XX New short interfering nucleic acids, useful e.g. for treatment and  
PT diagnosis of Alzheimer's disease, which down regulates expression of the  
PT beta-secretase gene.  
XX  
XX Example 3; SEQ ID NO 431; 144pp; English.  
XX  
XX The invention relates to short interfering nucleic acids (siNA) which  
CC downregulate expression of the human beta-secretase (BACE) gene by RNA  
CC interference. The siNAs may or may not comprise ribonucleotides and may  
CC be double or single stranded. They further comprise sense and antisense  
CC regions, or alternatively are assembled from a sense oligonucleotide and  
CC an antisense oligonucleotide. Specifically, the siNAs include short  
CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short  
CC hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified,  
CC can contain deoxyribonucleotides, and can be chemically synthesised,  
CC expressed from a vector or enzymatically synthesised. The invention also  
CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates  
CC and/or complexes of siNA; and vectors that express siNA. The siNAs are  
CC used to modulate expression of the BACE gene in cells, tissue explants or

CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants  
CC for the treatment of a variety of conditions. They may be used for  
CC treating Alzheimer's disease or other degenerative conditions such as  
CC dementia and stroke/cardiovascular accident. The siNAs are also useful  
CC for drug screening, diagnosis, therapeutic target identification and  
CC validation, genetic engineering, pharmacogenomics, studying gene  
CC function, and gene mapping (e.g., of single nucleotide polymorphisms).  
CC The present sequence represents the lower strand of a human BACE-targeted  
CC double-stranded siNA.

XX Pharmaceutical composition for treating ailments associated with impaired  
PT respiration, has oligo(s) antisense to specific gene(s) or its  
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
PT ubiquinone.  
XX  
XX Disclosure; SEQ ID NO 10457; 872pp; English.  
XX  
XX The invention relates to a novel pharmaceutical composition, which has a  
CC first active agent comprising an oligonucleotide antisense to the  
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
CC junctions of genes encoding a polypeptide associated with lung and/or  
CC nasal airway dysfunction and a second active agent comprising an  
CC antiinflammatory steroid and ubiquinone. A composition of the invention  
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
CC immunosuppressive, and cytostatic activity. The composition may have a  
CC use in antisense gene therapy. The composition is useful for treating or  
CC preventing a respiratory, lung or malignant disease or condition, also

for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

XX  
XX Pharmaceutical composition for treating asthma, has antisense  
XX oligonucleotide containing less percentage of adenosine, targeted to  
XX nucleic acids associated with lung airway or lung dysfunction, and  
XX bronchodilating agent.  
XX  
XX Claim 15; SEQ ID NO 10457; 763pp; English.  
XX  
XX This invention describes a novel composition (a) a first active agent,  
XX comprising oligonucleotides, effective for alleviating  
XX bronchoconstriction, respiratory tract inflammation, allergies and  
XX reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
XX surfactant depletion or hyposecretion, when administered to a mammal. The  
XX oligonucleotides are derived from a gene encoding or regulating  
XX expression of a target polypeptide associated with lung airway or lung  
XX dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
XX The invention also describes a kit, that comprises: (a) a delivery

device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has anti-allergic, anti-inflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

XX  
XX  
PS Disclosure; SEQ ID NO 793; 164pp; English.  
XX  
XX The invention relates to a kit for diagnosing and treating T-cell  
CC associated diseases which comprises a panel of nucleic acid primers  
CC specifically priming and allowing amplification of each Vbeta gene,  
CC VbetaNA or cDNA. The kit is useful for diagnosing organ transplant  
CC rejection and diagnosing and treating T-cell associated diseases  
CC including autoimmune diseases, degenerative nervous system diseases,  
CC graft versus host disease, hypersensitivity diseases, infectious diseases  
CC and neoplastic diseases. Autoimmune diseases include Addison's disease,  
CC atrophic gastritis, Degenerative nervous system diseases include multiple  
CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type  
CC I hypersensitivities such as contact with allergens that lead to  
CC allergies, Type II hypersensitivities such as those present in  
CC Goodpasture's syndrome and Type IV hypersensitivities such as those  
CC manifested in leprosy. Infectious diseases include viral infections  
CC caused by viruses such as HIV, fungal infections such as those caused by  
CC the yeast genus Candida, parasitic infections such as those caused by  
CC schistosomes, filaria and bacterial infections such as those caused by  
CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases  
CC such as leukaemias, lymphomas and cancers such as cancer of the brain,  
CC breast. The present sequence represents a Vbeta gene repeat sequence.

XX  
XX  
PS Disclosure; Page 29; 99pp; English.  
XX  
XX The present invention describes a method for inhibiting the expression of  
CC a gene in a cell comprising contacting the cell with an effective  
CC synergistic amount of an antisense oligonucleotide which inhibits  
CC expression of the gene, and an effective synergistic amount of a protein  
CC effector of a product of the gene. Also described are: (1) a method for  
CC treating a disease responsive to inhibition of a gene in a mammal; (2) a  
CC method for inhibiting tumour growth in mammal; (3) an inhibitor of a gene  
CC comprising an antisense oligonucleotide which inhibits expression of the  
CC gene in operable association with a protein effector of a gene product;  
CC and (4) a pharmaceutical composition comprising the inhibitor of (3). The  
CC methods and compositions are useful as analytical tools for transgenic  
CC studies and as therapeutic tools, e.g. as gene therapy tools for human  
CC diseases including benign and malignant tumours, inflammation or asthma.  
CC The methods, inhibitors and compositions of the invention that inhibit  
CC expression or activity of a gene or gene product may be used to treat  
CC patients having, or predisposed to developing, a disease responsive to  
CC inhibition of the gene. These may also be used to activate silenced genes  
CC to provide missing gene functions and improve a given condition.  
CC Furthermore, the methods and compositions are useful as probes of the  
CC physiological function of a gene product in an experimental cell culture  
CC or animal system; and to evaluate the effect of inhibiting gene activity  
CC or expression. AAA55758 to AAA55842 represent oligonucleotide sequences  
CC which are used in the exemplification of the present invention

XX New radiation hybrid map of the dog, Canine familiaris, genome, useful  
PT for e.g. identifying genes implicated in phenotypic and behavioral traits

PT or in genetic diseases and for studying dog pedigrees.

XX Claim 1; Page 59; 87pp; English.

XX The present invention describes a radiation hybrid map of the dog (Canine  
CC familiaris) genome comprising the genome location of a marker selected  
CC from AAH6613 to AAH66942. The radiation hybrid map is useful for  
CC identifying and localising dog genes, since it covers approximately 80 %  
CC of the dog genome and provides a dense map integrating different types  
CC (i.e. Type I and Type II) of markers. The map and the dog genome markers  
CC (or complementary sequences) are especially useful to identify genes  
CC responsible for phenotypic and behavioural traits in dogs, to identify  
CC morbid genes, to analyse diseases and identify implicated genes in such  
CC diseases and their alleles, and to study dog pedigrees. They may also be  
CC useful for isolating corresponding human gene sequences e.g. genes  
CC involved in genetic diseases

XX The present invention relates to ligand dependent transcriptional factors  
CC including oestrogen receptor (ER) alpha and beta protein, glucocorticoid  
CC receptor protein (GR), mineralocorticoid receptor protein (MR),  
CC peroxisome proliferator-activated receptor protein (PPAR), progesterone  
CC receptor protein (PR), progesterone X receptor protein (RXR), thyroid hormone  
CC acids encoding them and cells comprising them and a specified reporter  
CC gene for the ligand dependent transcriptional factor. These proteins are  
CC useful in the modulation of ligand dependent transcriptional factor  
CC activity. The cells, mutant ERalpha and the polynucleotide encoding it  
CC may be used in assays for qualitatively analysing an activity for  
CC transactivation of a reporter gene by a test ERalpha, for screening  
CC mutant ligand dependent transcriptional factors, for evaluating an  
CC activity for transactivation of a reporter gene by a test ERalpha and/or  
CC for screening a compound useful for treating a disorder of a mutant  
CC ERalpha, especially breast cancer

XX      New antisense compound that hybridizes and inhibits nucleic acid encoding
XX      cellular apoptosis susceptibility gene, useful for treating a
XX      hyperproliferative disorder such as cancer.
XX      Claim 3; Page 92; 135pp; English.
XX      The invention discloses antisense compounds, of 8 - 50 nucleobases in
XX      length, targeted to a nucleic acid molecule encoding a human cellular
XX      apoptosis susceptibility gene (CAS or CSE1 or CSP), located on chromosome
XX      20q13. CAS has been implicated in the regulation of mitosis, apoptosis
XX      and cellular proliferation and is highly expressed in some cancer cells.
XX      CAS has also been shown to mediate export of importin-alpha from the
XX      nucleus. Importin-alpha is a nuclear import receptor for nuclear
XX      localisation signal-containing proteins and deregulation of importin
XX      transport is involved in cell cycle defects. The antisense compounds
XX      specifically hybridise with, and inhibit expression of, the gene or
XX      CC specifically hybridise with an 8 nucleobase portion of its active site.
XX      The antisense compounds are useful for inhibiting the expression of a
XX      cellular apoptosis susceptibility gene in cells or tissues and for
XX      treating an animal having a disease or condition associated with a
XX      cellular apoptosis susceptibility gene, where the disease or condition is
XX      a hyperproliferative disorder such as cancer, preferably breast or colon
XX      cancer, degenerative disorders such as Alzheimer's disease, Parkinson's
XX      disease, amyotrophic lateral sclerosis (ALS), retinitis pigmentosa and
XX      blood cell disorders. The compounds are also useful for diagnostics,
XX      therapeutics, prophylaxis, as research reagents and kits, for
XX      distinguishing functions of various members of a biological pathway, in
XX      antisense gene therapy and prophylactically (e.g. to prevent or delay
XX      infection, inflammation or tumour formation). The antisense
XX      oligonucleotides in ABS59252-ABS59322 are targeted to the human CAS gene

 XX Novel polynucleotide useful for detecting single nucleotide polymorphisms  
 DR in human gene.  
 PT Claim 2; SEQ ID NO 2044; 704bp; Japanese.  
 PS The invention relates to a novel polynucleotide isolated and purified  
 CC from a human gene having any one of 935 fully defined sequences as given  
 CC in specification, or a sequence having a base substitution. The invention  
 CC further relates to: an oligonucleotide containing single nucleotide  
 CC polymorphisms; a PCR primer set chosen from the combination of two DNA  
 CC fragments from any one of 1220 fully defined sequences as given in  
 CC specification; a labelling probe containing the SNP containing oligo; and  
 CC a microarray equipped with the SNP containing oligo. The isolated human

CC gene of the invention is useful for detecting the single nucleotide  
 CC polymorphisms in human gene. The isolated human gene is also useful for  
 CC diagnosis of disease and determination of side effect to a medical agent.  
 CC The isolated human gene is also effective in detecting single nucleotide  
 CC polymorphisms in a human gene. This polynucleotide sequence represents  
 CC one of the PCR primers used in the single nucleotide polymorphism  
 CC detection method of the invention.

New antisense oligonucleotides targeted to a nucleic acid encoding liver

related homologue-1 (LRH1), useful for treating breast cancer,

dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.

XX Example 15; SEQ ID NO 60; 909pp; English.

XX This invention relates to novel antisense compounds useful for modulating

XX the expression of liver related homologue-1 (LRH1) and splice variants

XX thereof. Specifically, it refers to compositions 8-30 nucleobases in

XX length that target a portion of an active site on the nucleic acid

XX molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan

XX nuclear receptor protein that functions as a tissue specific

XX transcription factor. The present invention describes antisense

XX oligonucleotides that comprise at least one modified internucleoside

XX linkage, a phosphorothioate linkage, at least one modified sugar moiety,

XX a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-

XX methylcytidine. These antisense compounds are useful for treating or

XX diagnosing a disease associated with LRH1, such as breast cancer,

XX dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high

XX LDL (low density lipoprotein), hypercholesterolaemia, gall stones,

XX triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic

XX hepatitis, as well as hepatocellular carcinoma or a condition associated

XX with aromatase activity. Accordingly, these compositions exhibit

XX cytosatic, antilipemic, antiarteriosclerotic, anorectic, hepatotropic,

XX litholytic, antiinflammatory and virucidal activities. This

XX oligonucleotide sequence is an antisense DNA oligo used to modulate the

XX expression of the human LRH1 protein of the invention.

XX
XX New antisense oligonucleotides targeted to a nucleic acid encoding liver
XX related homologue-1 (LRH1), useful for treating breast cancer,
XX dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
XX Example 15; SEQ ID NO 66; 909pp; English.
XX
XX This invention relates to novel antisense compounds useful for modulating
XX the expression of liver related homologue-1 (LRH1) and splice variants
XX thereof. Specifically, it refers to compositions 8-30 nucleobases in
XX length that target a portion of an active site on the nucleic acid
XX molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
XX nuclear receptor protein that functions as a tissue specific
XX transcription factor. The present invention describes antisense
XX oligonucleotides that comprise at least one modified internucleoside
XX linkage, a phosphorothioate linkage; at least one modified sugar moiety,
XX a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
XX methylcytidine. These antisense compounds are useful for treating or
XX diagnosing a disease associated with LRH1, such as breast cancer,
XX dyslipidemia, atherosclerosis, low HDL (high density lipoprotein), high
XX LDL (low density lipoprotein), hypercholesterolemia, gall stones,
XX triglyceridemia, obesity, hepatitis B virus-mediated acute or chronic
XX hepatitis, as well as hepatocellular carcinoma or a condition associated
XX with aromatase activity. Accordingly, these compositions exhibit
XX cytostatic, antiinflammatory, antiarteriosclerotic, anorectic, hepatotropic,
XX litholytic, antiinflammatory and virucidal activities. This
XX oligonucleotide sequence is an antisense DNA oligo used to modulate the
XX expression of the human LRH1 protein of the invention.

XX  
XX New compounds targeted to nucleic acid molecules encoding AP-2 alpha and  
PT inhibits the expression of AP-2 alpha, useful for treating AP-2 alpha-  
PT associated disease or condition, particularly a hyperproliferative  
PT disorder.  
XX  
XX Example 15; SEQ ID NO 67; 58pp; English.  
XX  
XX The invention describes a compound (I) 8-80 nucleobases in length  
CC targeted to a nucleic acid molecule encoding AP-2 alpha. The compound  
CC specifically hybridizes with a nucleic acid molecule encoding AP-2 alpha  
CC (19868 bp, SEQ ID NO: 4), and inhibits the expression of AP-2 alpha. Also  
CC described are: inhibiting the expression of AP-2 alpha in cells or tissues  
CC comprising contacting the cells or tissues with (I); screening for a  
CC modulator of AP-2 alpha by contacting a preferred target segment of a  
CC nucleic acid molecule encoding AP-2 alpha with one or more candidate  
CC modulators of AP-2 alpha, and identifying one or more modulators of AP-2  
CC diagnostic method for identifying a disease state; and a kit or assay  
CC device comprising (I). The compound is useful for treating an animal  
CC having a disease or condition associated with AP-2 alpha, particularly a  
CC hyperproliferative disorder. The compounds may be used for diagnostics,  
CC therapeutic prophylaxis and as research reagents; or as tools in  
CC differential and/or combinatorial analyses to elucidate expression  
CC patterns of a portion or the entire complement of genes expressed within  
CC cells and tissues. This sequence represents a human transcription factor  
CC AP-2 antisense oligonucleotide.

XX
XX  Determination of presence of mutation conferring pathological condition
XX  mediated by altered ion transport - comprises analysing sample for
XX  presence of mutation of potassium ion channel gene, ENaC, or in its
XX  encoded protein.
XX
XX  Example 1; Page 38; 56pp; English.
XX
XX  Sequences shown in AAV57601 to AAV57686 represent primers used for the
XX  PCR amplification of the exons of the different subunits of the human
XX  epithelial sodium channel (ENaC) gene. This is used in the method of the
XX  invention of determining the presence or absence of a mutation conferring
XX  a pathological condition mediated by altered ion transport. The method
XX  comprises analysing a nucleic acid sample, or protein sample, for the
XX  presence of a mutation in the ENaC gene, or in its encoded protein. A
XX  vector containing a nucleic acid encoding a human altered variant of the
XX  ENaC protein can be used to transform host cells to produce an altered
XX  variant of an ENaC protein. The protein can be used to identify agents
XX  that effect ion transport. The agonists can be used to treat pathological
XX  conditions resulting from abnormal ion transport, such as water
XX  retention, increased blood pressure, chronic respiratory and metabolic
XX  acidosis and inflammation

XX  Identifying target genes for allele-specific drugs - used for diagnosis,
XX  prevention and treatment of, e.g. cancer; atherosclerotic plaque,
XX  dysplastic lesions, endometriosis or graft versus host disease.
XX
XX  Disclosure; Fig 7; 605pp; English.
XX
XX  This invention describes a novel method for identifying an inhibitor
XX  potentially useful for treatment of cancer, where the inhibitor is active
XX  on a gene vital for cell growth or viability, and where the gene is
XX  subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
XX  used for preventing the development of cancer in a patient having a
XX  precancerous condition, by administering to the patient a first allele
XX  specific inhibitor (ASI) targeted to an allele of a first essential gene
XX  present in cells of the precancerous condition, where the normal somatic
XX  cells of the patient are heterozygous for the first gene, the inhibitor
XX  is active on at least one but less than all allelic forms of the gene
XX  present in a population and targets only one allelic form present in the
XX  normal somatic cells, and the first gene. The products and methods can be
XX  used in the diagnosis, prevention and treatment of LOH disorders, e.g.
XX  cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
XX  lesions, benign tumours, endometriosis, polycystic kidney disease, and
XX  graft versus host disease. The method can also be used to remove
XX  malignant cells from bone marrow transplants. AAZ25812-226825 represent
XX  human polymorphic sites described in the method of the invention

XX PT New polynucleotides encoding a polypeptide having heparanase activity,
XX PT useful in wound healing and in gene therapy, particularly in treating
XX PT tumor, inflammation, autoimmunity, neurodegenerative diseases.
XX PS
XX XX Example 6; Page 53; 152pp; English.
XX CC The present PCR primer was used to amplify a human cDNA sequence, which
XX CC encoded a protein with heparanase catalytic activity. The heparanase
XX CC (hpa) polynucleotide is useful in gene therapy, particularly in treating
XX CC tumour, inflammation or autoimmunity. Particularly, the polynucleotide is
XX CC useful in modulating the bioavailability of heparin-binding growth
XX CC factors, cellular responses to heparin-binding growth factors (e.g. bFGF)
XX CC and cytokines (e.g. interleukin (IL)-8), cell interaction with plasma
XX CC lipoproteins, cellular susceptibility to certain viral and some bacterial
XX CC and protozoal infections, or disintegration of neurodegenerative plaques.
XX CC The polynucleotide is also useful in wound healing (e.g. thermal,
XX CC chemical or radiation burns), and in the treatment of angiogenesis,
XX CC restenosis, atherosclerosis, inflammation, neurodegenerative diseases
XX CC (Gerstmann-Strausler Syndrome or Creutzfeldt-Jakob disease), and some
XX CC viral, bacterial or protozoal infections.

XX Screening for susceptibility to sub-optimal norepinephrine transport,  
PT particularly orthostatic intolerance in a subject by detecting a  
PT polymorphism of norepinephrine transporter gene.  
XX  
PS Example; Page 66; 133bp; English.  
XX PCR primers AAH28091-92 were used to amplify an exon of the human  
CC norepinephrine transporter. The specification a method for screening for  
CC susceptibility to sub-optimal norepinephrine transport in a subject. The  
CC method comprises obtaining a biological sample from the subject and  
CC detecting a polymorphism of a norepinephrine transporter gene in the  
CC sample from the subject, the presence of the polymorphism indicating the  
CC susceptibility of the subject to sub-optimal norepinephrine transport.  
CC The method is useful for screening for susceptibility of a subject to  
CC orthostatic intolerance. Norepinephrine transporter genes are useful for  
CC gene therapy for modulating norepinephrine transport in a target cell and  
CC treating susceptibility to impaired norepinephrine transporter function,  
CC orthostatic intolerance or other relevant diseases in humans and animals  
CC such as mental illness, hypertension, heart disease, psycho stimulant  
CC abuse e.g. cocaine or amphetamine abuse

XX Composition for treating hormone-regulated cancer, particularly of  
PT prostate or breast, comprises oligonucleotide antisense to insulin-like  
PT growth factor binding protein-2.  
XX  
PS Example 1; Page 13; 36bp; English.  
XX  
CC The present invention relates to a new composition for treating hormone-

CC regulated cancer. The composition comprises an antisense oligonucleotide  
CC that inhibits expression of IGFBP-2 (insulin-like growth factor binding  
CC protein-2). The molecules of the invention are used to delay progression  
CC of hormone-regulated tumours, particularly of breast or prostate, to the  
CC hormone-independent state, to delay metastatic progression to the bone of  
CC IGF-1-sensitive cancers and to treat hormone-responsive cancers by  
CC inducing apoptosis, after hormonal withdrawal. The present nucleic acid  
CC sequence represents one of a collection (ABK70313-ABK70375) of antisense  
CC IGFBP-2-oligodeoxynucleotides (ODN) that were used in the invention for  
CC prostate and other endocrine tumour therapy

Identifying an individual who has altered risk for developing stenosis

comprises detecting single nucleotide polymorphism (SNP), in the

individual's nucleic acids.

Claim 19; SEQ ID NO 68256; 146bp; English.

The invention relates to identifying an individual who has altered risk

for developing coronary stenosis comprising detecting a single nucleotide

polymorphism (SNP) in any one of the 67073 nucleotide sequences (not

given in the specification), in the individual's nucleic acids, where the

presence of the SNP is correlated with an altered risk for stenosis in

the individual. Also included are an isolated nucleic acid molecule

(comprising at least 8 contiguous nucleotides where one of the

nucleotides is an SNP as cited above, or their complement), an isolated

polypeptide comprising an amino acid sequence selected from any of the

666 amino acid sequences (not defined in the specification), an antibody

that specifically binds to the polypeptide (or its antigen-binding

fragment), an amplified polynucleotide containing the SNP as cited (where

CC the amplified polynucleotide is between about 16 and about 1,000  
 CC nucleotides in length), an isolated polynucleotide which specifically  
 CC hybridises to a nucleic acid molecule containing the SNP, a kit for  
 CC detecting a SNP in a nucleic acid, detecting a SNP in a nucleic acid  
 CC molecule, detecting a variant polypeptide and identifying an agent useful  
 CC in therapeutically or prophylactically treating stenosis. The detection  
 CC step of the method is carried out by a process selected from allele-  
 CC specific probe hybridisation, allele-specific primer extension, allele-  
 CC specific amplification, sequencing, 5' nuclease digestion, molecular  
 CC beacon assay, oligonucleotide ligation assay, size analysis, and single-  
 CC stranded conformation polymorphism. The method is useful for identifying  
 CC an individual who has altered risk for developing coronary stenosis,  
 CC which can lead to angina (ischaemic chest pain), myocardial infarction  
 CC and ultimately sudden cardiac death. The present sequence is an allele  
 CC specific primer for amplifying a SNP-containing region of a human marker  
 CC gene associated with stenosis. NOTE: SRO ID 1-67771 are not shown in the  
 CC specification but are provided on a CD-R named CU001510CDR which was not  
 CC supplied with the specification.

New nuclease-resistant oligonucleotides having modified non-terminal

pyrimidine nucleoside(s), useful e.g. for treating cancer or viral

diseases or as diagnostic reagents.

Claim 1; Page 16; 19pp; German.

CC The present invention relates to oligonucleotides having at least one non  
CC terminal pyrimidine nucleoside modified and additionally having the 5'-  
CC and/or 3'-terminal modified. These can be used in the treatment of viral  
CC infections, such as HIV, HSV-1, HSV-2, influenza virus, VSV, hepatitis B  
CC and papilloma viruses, cancer and diseases involving integrins and cell-  
CC cell adhesion receptors. The present sequence is an antisense  
CC oligonucleotide specifically excluded by the invention

XX Enzymatic polynucleotide that down regulates expression of chloride

XX channel calcium activated gene, useful for treating Chronic obstructive

XX pulmonary disease (COPD), chronic bronchitis and asthma.

XX Claim 4; Page 136; 152pp; English.

XX The invention relates to enzymatic nucleic acid molecules that down  
CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes  
CC by cleaving RNA derived from the genes. The nucleic acid sequences are  
CC useful as pharmaceutical agents for treating conditions such as chronic  
CC obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic  
CC fibrosis, obstructive bowel syndrome and any other diseases or conditions  
CC that are related to or will respond to the levels of CLCA1 in a cell or  
CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,  
CC hence, are useful for treatment of a patient having a condition  
CC associated with the level of CLCA1, where the invention further comprises  
CC the use of one or more therapies under conditions suitable for the  
CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,  
CC antibacterials, vaccinations, acetylcytosteine and mucokinetic agents. The

CC nucleic acids of the invention are also used as diagnostic tools to  
CC examine genetic drift and mutations within diseased cells or to detect  
CC the presence of CLCA1 RNA in a cell. This sequence represents an  
CC enzymatic nucleic acid molecule of the invention

 XX  
 CC The present invention relates to promoting hair growth in a subject which  
 CC involves inducing or mimicking the effect of Wnt-promoted signal  
 CC transduction in a subject and inhibiting hair growth in a subject  
 CC involves inhibiting level of Wnt protein or inhibiting an effect of Wnt-  
 CC promoted signal transduction in a subject. The invention is used for  
 CC providing and maintaining dermal papilla (DP) cell graft which involves  
 CC culturing a DP cell from a subject under conditions that induce or mimic  
 CC the effect of Wnt-promoted signal transduction, thereby providing and  
 CC maintaining a DP cell graft. Preferably, the DP cell is cultured in the  
 CC presence of Wnt, its fragment or analogue; lithium chloride, beta-catenin  
 CC and/or Lef1, an agent which inhibits beta-catenin phosphorylation or  
 CC GSK3beta kinase, or an agent which promotes beta-catenin accumulation.  
 CC Hair growth is promoted in subject's scalp, or face e.g., beard and/or  
 CC mustache, or in conditions where subject suffers from genetic pattern  
 CC baldness, suffers from a hormonal disorder which decreases hair growth,  
 CC has received a treatment, e.g., radiation or chemotherapy, or a drug  
 CC which inhibits hair growth, or has had a surgical procedure, e.g., skin  
 CC graft, which is in need of hair growth. Hair growth is inhibited on the  
 CC subject's scalp, subject's face, e.g., beard and/or mustache, facial hair  
 CC growth, or eyebrow growth, back, legs, chest, armpits. Promoting hair  
 CC growth is useful for maintaining or promoting hair inductive activity.  
 CC Inhibiting hair growth is useful for maintaining or promoting anagen  
 CC phase gene expression in the subject's scalp, face e.g., upper lip and/or

CC chin. The present sequence is Wnt3 RT-PCR primer used in the method for  
 CC modulating hair growth

New streptavidin mutants - have increased stability or altered affinity for biotin.

Example 14; Page 33; 91pp; English.

Two 21-mer oligonucleotides (AA072522 and AA072523) were annealed and the resulting double-stranded DNA was ligated into the EcoRI and BamHI sites of the predigested DNA of a plasmid encoding residues 16 to 133 of streptavidin with lys at position 127. The gene was cloned into a bacterial expression vector and the mutated streptavidin expressed and purified. The mutant streptavidin forms heterotetramers in solution and with Phe at position 120, has a reduced biotin-binding affinity of less than about 10 power 8/M. It can be conjugated to other proteins and macromolecules, and also to solid supports through the sulphhydryl group on the cysteine residues

 PT Altering the state of differentiation in multipotent stem cells which may  
 PT be used in cell therapy applications, comprises administering one or more  
 PT engineered zinc finger proteins to the multipotent stem cells.  
 PS  
 XX Example 3; Page 74; 88pp; English.  
 XX  
 CC This invention relates to a method for altering the state of  
 CC differentiation in a cell or population of cells, which comprises of the  
 CC administration of one or more engineered zinc finger proteins (ZFPs) to  
 CC the cell or population of cells (the ZFPs alter the state of cellular  
 CC differentiation). The method is considered antidiabetic, neuroprotective,  
 CC neurotropic, cytoskeletal, antiarthritic, antirheumatic, anti-HIV,  
 CC cerebroprotective and vasotropic. The methods and compositions are useful  
 CC in modifying stem cells using ZFPs, and in facilitating processes such as  
 CC dedifferentiating stem cells, differentiating stem cells into the desired  
 CC phenotype, propagating stem cells and/or facilitating cloning. The  
 CC composition may also be used in cell therapy techniques. In tissue  
 CC engineering techniques, and in gene therapy. The method has the ability  
 CC to directly and specifically control core processes that direct stem cell  
 CC differentiation, to limit or eliminate uncontrolled massive over-  
 CC expression of a target protein to toxic levels, to direct stem cell  
 CC differentiation or dedifferentiation through epigenetic mechanisms, to  
 CC screen ZFP-TF libraries for ZFP-TFs that control differentiation, to  
 CC generate animal models of ZFP-TF expression and in vivo regulation of  
 CC stem cell differentiation. This sequence represents the a probe used  
 CC during RNA analysis during the engineering of zinc finger proteins

 XX  
 PS Example 5; SEQ ID NO 1; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetric 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (II): reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control Apob gene expression.

PT GTP binding protein conjugate-type receptor protein for screening  
 PT candidate drugs for signal transduction modification.

XX Example 2; Page 24; 77bp; English.

CC This sequence is a PCR primer for DNA encoding the human guanosine  
 CC triphosphate binding protein (G-protein) conjugate-type receptor protein  
 CC (designated BG2) of the invention. BG2 is a member of the G-protein  
 CC conjugate-type receptor super family and shows significant homology to  
 CC other muscarinic acetylcholine receptors. BG2 can be used in a screening  
 CC method for identifying ligands binding to the BG2 receptor and for  
 CC compounds which are agonists or antagonists to the binding of ligands to  
 CC BG2 receptor, and which can be used for the regulation of signal  
 CC transduction, and thus for the prevention and treatment of memory and  
 CC learning difficulties and disorders of the control of physiological  
 CC functions such as blood pressure, digestion and sleep

PT G protein coupled receptor protein expressed in brain tissue for  
 PT screening signal transduction regulators for use as drugs.

XX Example 2; Page 28; 101bp; Japanese.

CC Primers AAA70649-A70654 are used to PCR amplify cDNA sequence of exons in  
 CC a gene for a human guanosine triphosphate binding protein (G-protein)  
 CC coupled receptor protein (GCRP). The invention relates to the isolation  
 CC of genes for novel GCRP's (AAB15381-B15382) designated BG2 from human and  
 CC rat. The GCRP is expressed in brain tissue and binds to histamine. The  
 CC DNA and protein can be used in the identification of compounds which  
 CC regulate the signal transduction of BG2 and are useful as drugs for the  
 CC treatment and prevention of disorders including Alzheimer's disease,  
 CC memory loss, schizophrenia, insomnia, narcolepsy, rheumatoid arthritis,  
 CC colitis, hypertension, hypotension, Huntington's disease, anorexia,  
 CC obesity and pain

XX
XX XX New gene (BNO1) mapping to chromosome 16q24.3, useful in gene therapy,
XX PT e.g. for diagnosing or treating cancers (e.g. lymphoma),
XX PT immune/inflammatory diseases (e.g. AIDS) or neurological disorders (e.g.
XX PT Parkinson's disease).
XX
XX PS Example 8; Page 63; 85pp; English.
XX
XX CC The invention relates to the human and murine BNO1 proteins and nucleic
XX CC acids encoding them. The BNO1 protein is a member of the FBXO class of F-
XX CC box proteins, containing an F-box motif but no other known protein-
XX CC interaction domains. Proteins which contain F-boxes are the substrate
XX CC recognition components of SCF ubiquitin-E3 ligases, which are responsible
XX CC for ubiquitinating proteins, thereby targeting them for degradation in
XX CC the proteasome. In addition, BNO1 is able to interact with Skp1, an
XX CC essential component of SCF ubiquitin-E3 ligases, suggesting that it plays
XX CC a role in the ubiquitin-proteasome degradation system that is involved in
XX CC the regulation of many proteins, particularly those involved in important
XX CC cellular processes such as cell cycle regulation. The human BNO1 gene
XX CC maps to chromosome 16q24.3, and is expressed as two different isoforms.
XX CC Isoform 1 consists of 539 amino acids and is encoded by an open reading
XX CC frame (ORF) of 1617 bp, while the longer isoform 2 consists of 568 amino
XX CC acids encoded by an ORF of 1704 bp. The mRNAs encoding the 2 human BNO1
XX CC isoforms are the product of differential splicing; both comprise exons 1-
XX CC 9, but the isoform 2 mRNA additionally comprises exon 2.5. Loss of
XX CC heterozygosity (LOH) of the long arm of chromosome 16, in which the human
XX CC BNO1 gene is situated, is implicated in breast and prostate cancer, and
XX CC BNO1 expression is also downregulated in these cancers. BNO1 nucleic
XX CC acids, proteins and compounds which modulate BNO1 activity or expression
XX CC may be used for treating disorders associated with altered BNO1 activity
XX CC or expression. Such disorders include cancers (e.g., breast, prostate,
XX CC liver and ovarian cancers), immune/inflammatory diseases (e.g., AIDS
XX CC (acquired immunodeficiency syndrome), asthma, Crohn's disease or multiple
XX CC sclerosis) or neurological disorders (e.g., Parkinson's disease or
XX CC Alzheimer's disease). BNO1 nucleic acids, proteins and antibodies may
XX CC also be used to diagnose or prognose disorders associated with BNO1
XX CC dysfunction, or a predisposition to these disorders. Additionally, BNO1
XX CC nucleic acids and proteins, and transgenic animals comprising human BNO1
XX CC nucleic acid sequences or in which BNO1 gene function has been knocked

```

```

CC CC out are useful in screening potential drugs for treating BNO1-associated
CC CC disorders, and the human BNO1 protein isoforms are particularly useful
CC CC for identifying BNO1-specific protein substrates that are targeted for
CC CC degradation by ubiquitination. Sequences AB094326-AB094349 represent
CC CC human BNO1 gene-specific PCR primers used in SSCP (single-strand
CC CC conformation polymorphism) analysis of tumours and cell lines for BNO1
CC CC mutations in an exemplification of the invention

CC interference. The siRNAs may or may not comprise ribonucleotides and may  
 CC be double or single stranded. They further comprise sense and antisense  
 CC regions, or alternatively are assembled from a sense oligonucleotide and  
 CC an antisense oligonucleotide. Specifically, the siRNAs include short  
 CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short  
 CC hairpin RNA (shRNA). The siRNAs can be unmodified or chemically modified,  
 CC can contain deoxyribonucleotides, and can be chemically synthesised,  
 CC expressed from a vector or enzymatically synthesised. The invention also  
 CC relates to kits for the in vitro or in vivo delivery of siRNA, conjugates  
 CC and/or complexes of siRNA; and vectors that express siRNA. The siRNAs are  
 CC used to modulate expression of EGFR genes in cells, tissue explants or  
 CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants  
 CC for the treatment of a variety of conditions. They may be used for  
 CC treating a wide range of cancers such as breast and ovarian cancer. The  
 CC siRNAs are also useful for drug screening, diagnosis, therapeutic target  
 CC identification and validation, genetic engineering, pharmacogenomics,  
 CC studying gene function, and gene mapping (e.g., of single nucleotide  
 CC polymorphisms). The present sequence represents the lower strand of a  
 CC human HER1 (EGFR)-targeted double-stranded siRNA.

 PS Example 3; SEQ ID NO 639; 17bp; English.

XX  
 CC The invention relates to short interfering nucleic acids (siNA) which  
 CC downregulate expression of one or more human epidermal growth factor  
 CC receptor (EGFR) genes (including HER1, HER2, HER3 and HER4) by RNA  
 CC interference. The siRNAs may or may not comprise ribonucleotides and may  
 CC be double or single stranded. They further comprise sense and antisense  
 CC regions, or alternatively are assembled from a sense oligonucleotide and  
 CC an antisense oligonucleotide. Specifically, the siRNAs include short  
 CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short  
 CC hairpin RNA (shRNA). The siRNAs can be unmodified or chemically modified,  
 CC can contain deoxyribonucleotides, and can be chemically synthesised,  
 CC expressed from a vector or enzymatically synthesised. The invention also  
 CC relates to kits for the in vitro or in vivo delivery of siNA; conjugates  
 CC and/or complexes of siNA; and vectors that express siNA. The siRNAs are  
 CC used to modulate expression of EGFR genes in cells, tissue explants or  
 CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants  
 CC for the treatment of a variety of conditions. They may be used for  
 CC treating a wide range of cancers such as breast and ovarian cancer. The  
 CC siRNAs are also useful for drug screening, diagnosis, therapeutic target  
 CC identification and validation, genetic engineering, pharmacogenomics,  
 CC studying gene function, and gene mapping (e.g., of single nucleotide  
 CC polymorphisms). The present sequence represents the upper strand of a  
 CC human HER1 (EGFR)-targeted double-stranded siNA, which is identical to  
 CC the HER1 transcript target sequence.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
PT disease, diabetes, cancer or neurological disease, comprises sense  
PT sequence and antisense sequence which has specific modifications.

XX  
PS Example 5; SEQ ID NO 1146; 378bp; English.  
XX  
XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
CC sense sequence and an antisense sequence, where the sense sequences have  
CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
CC sequences have one or more asymmetrical phosphorothioate modifications  
CC and the antisense sequence targets a human gene sequence. Also described  
CC are: a pharmaceutical preparation comprising (I); reducing (M) apoB-100  
CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
CC stabilising (I), involves selecting a sequence with activity and  
CC introducing one or more asymmetrical modification in the sequence, where  
CC the modification decreases nuclease sensitivity while not decreasing its  
CC activity; a kit comprising (I) and instruction for its use; and a device  
CC that can be dispense or administer a composition comprising (I). (I) is  
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M)  
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
CC The subject is suffering from a disorder characterised by elevated or  
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
CC dyslipidemias, hypercholesterolaemia, statin-resistant  
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
CC inhibit hepatic glucose production or for treating glucose-metabolism-  
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
CC lung cancer), neurological disease (e.g., Huntington disease or  
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
CC can be used to control ApoB gene expression.

XX
XX
XX Interference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 3668; 378bp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are pharmaceutical preparations comprising (I); reducing (M1) apob-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)
XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX dyslipidaemias, hypercholesterolaemia, statin-resistant
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or

(ALANY-) ALANYLAM PHARM.

Manoharan M, Bumcrot D;

WPI; 2004-677362/66.

Interference RNA agent useful for treating dyslipidemia, coronary artery  
PT disease, diabetes, cancer or neurological disease, comprises sense  
PT sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 1004; 378bp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a

CC sense sequence and an antisense sequence, where the sense sequences have  
CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
CC sequences have one or more asymmetrical phosphorothioate modifications  
CC and the antisense sequence targets a human gene sequence. Also described  
CC are: a pharmaceutical preparation comprising (I); reducing (M) apoB-100  
CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
CC stabilising (I), involves selecting a sequence with activity and  
CC introducing one or more asymmetrical modification in the sequence, where  
CC the modification decreases nuclease sensitivity while not decreasing its  
CC activity; a kit comprising (I) and instruction for its use; and a device  
CC that can be dispense or administer a composition comprising (I). (I) is  
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M)  
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
CC The subject is suffering from a disorder characterised by elevated or  
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
CC dyslipidaemia, hypercholesterolaemia, statin-resistant  
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
CC inhibit hepatic glucose production or for treating glucose-metabolism-  
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
CC lung cancer), neurological disease (e.g., Huntington disease or  
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
CC can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 3948; 378bp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (M1)
XX is useful for reducing apob-100 levels or glucose-6-phosphatase levels.
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apob-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX dyslipidaemias, hypercholesterolaemia, statin-resistant
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX lung cancer), neurological disease (e.g., Huntington disease or
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX can be used to control ApoB gene expression.

PS Example 1; Col 9; 12pp; English.

CC The following methods have been developed for detecting small deletions,  
 CC insertions or point mutations in an angiotensin-converting enzyme (ACE)  
 CC gene of a human patient: (1) a method comprising: (a) isolating an ACE  
 CC genomic DNA sequence from the patient, where the sequence spans intron  
 CC 25, using oligonucleotide primers in the 3' region of exon 25 and the 5'  
 CC region of exon 26; (b) hybridizing the genomic sequence with a detectable  
 CC probe specific for the corresponding sequence with no mutations; and (c)  
 CC detecting mismatches between the genomic sequence and the probe; (2) a  
 CC method comprising: (a) isolating an ACE genomic DNA sequence as in (1);  
 CC (b) amplifying the sequence; (c) hybridizing the amplification products  
 CC with a probe as in (1); and (d) detecting mismatches between the  
 CC amplification products and the probe; (3) a method comprising: (a)  
 CC isolating an ACE genomic DNA sequence as in (1); (b) denaturing the  
 CC genomic sequence to obtain single-stranded DNA; (c) hybridizing the  
 CC single-stranded DNA with a probe as in (1); and (d) detecting mismatches  
 CC between the single-stranded DNA and the probe; (4) a method comprising:  
 CC (a) isolating an ACE genomic DNA sequence as in (1); (b) amplifying the  
 CC sequence; (c) denaturing the amplification products to obtain single-  
 CC stranded DNA; (d) hybridizing the single-stranded DNA with a probe as in  
 CC (1); and (e) detecting mismatches between the single-stranded DNA and the  
 CC probe. The methods are used for assessing the patient's risk of  
 CC developing cardiovascular disease. The present sequence represents a PCR  
 CC primer for ACE

XX Protection of mammalian cells against immunotoxicity or lipotoxicity -

PT used for treating, e.g. diabetes, obesity, wasting syndromes,  
 PT osteoporosis, inflammatory diseases, autoimmune diseases or  
 PT neurodegenerative diseases.

XX Example 1; Page 155; 253pp; English.

XX Inhibition of cytokine mediated immunotoxicity of cells can be achieved  
 CC by blocking free radical production or the accumulation of free radicals  
 CC in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can  
 CC be achieved by by blocking nitric oxide (NO) production in a pancreatic  
 CC beta cell and by providing a composition comprising an agent that reduces  
 CC levels of fatty acids in the cells and protects beta-cells of the subject  
 CC against lipid-mediated cell death. Cells can also be protected against  
 CC nitric oxide mediated cytotoxicity by introducing into the cell an  
 CC antioxidant agent. The methods can be used for protecting cells against  
 CC immunotoxicity mediated by, e.g. IL-1 beta, IL-1 alpha, gamma IFN, TNF  
 CC alpha, TNF beta, IL-8, IL-2, IL-3, IL-5, IL-7, IL-9, IL-14,  
 CC IL-17, granulocyte-macrophage colony stimulating factor or monocyte  
 CC chemoattractant protein-1. The methods can be used for the treatment of  
 CC e.g. insulin-dependent diabetes mellitus (IDDM), NIDDM, obesity, wasting  
 CC syndromes, short stature, osteoporosis, inflammatory diseases, autoimmune  
 CC diseases, or neurodegenerative diseases. Two primers (AAZ08437, AAZ08438)  
 CC were used to amplify the interferon gamma receptor gene sequence

 PT -1 and which specifically hybridizes with and inhibits the expression of  
 PT human fra-1, useful for modulating the expression of fra-1 in cells.  
 XX

PS Claim 3; Col 40; 38bp; English.

XX The present sequence is one of a large number of antisense  
 CC oligonucleotides which are targeted to nucleic acids encoding fra-1. The  
 CC sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides  
 CC containing a central gap region consisting of ten 2'-deoxynucleotides,  
 CC which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The  
 CC oligonucleotides have a phosphorothioate backbone and the cytidine  
 CC residues in the 2'-MOE wings are 5-methylcytidines. The fra-1 antisense  
 CC oligonucleotides are useful for inhibiting the expression of fra-1 in  
 CC human cells or tissues. They can be used for diagnostics, therapeutics,  
 CC prophylaxis and as research reagents and in kits. Use of the antisense  
 CC compounds may also be useful prophylactically, e.g. to prevent or delay  
 CC infection, inflammation or tumour formation

XX  
XX  
PS Claim 3; Page 82; 106pp; English.  
XX  
XX The invention relates to antisense compounds targeted to nucleic acid  
CC encoding glycogen synthase kinase 3-beta (GSK3B) (also known as tau  
CC protein kinase I (TPK-I)). The antisense compound is useful for  
CC inhibiting the expression of glycogen synthase kinase 3-beta enzyme in  
CC cells or tissues and for treating diseases or conditions associated with  
CC the enzyme such as insulin regulation disorder, in particular diabetes  
CC and neurological disorder, e.g. Alzheimer's disease and bipolar illness.  
CC The antisense compound is also useful for diagnosing diseases associated  
CC with the expression of glycogen synthase kinase 3-beta and for  
CC prophylaxis e.g. to prevent or delay infection, inflammation or tumour  
CC formation and as a research reagent. The present sequence is an antisense  
CC compound targeted to human glycogen synthase kinase 3-beta mRNA

PT preventing collagen disorders.  
XX  
XX  
PS Claim 10; Page 8; 30pp; English.  
XX  
XX The present sequence is that of 1 of 12 claimed antisense  
CC oligonucleotides (ASOs, see AAF90492-503) of the invention. These ASOs  
CC are complementary to regions of the human gene (see AAF90491) for the pro  
CC -alpha-1 chain of type I procollagen. They are capable of inhibiting the  
CC expression of type I procollagen pro-alpha-1 chain in a cell that  
CC expresses it. The ASO, or a pharmaceutical composition including it, is  
CC used in a claimed method of treating, or reducing a risk of, a collagen  
CC disorder. Such disorders may include those caused by overproduction of  
CC collagen fibres, such as liver cirrhosis, kidney, liver and heart  
CC fibrosis, scleroderma, hypertrophic scars and keloids. The present ASO,  
CC when administered to human WI-26 cells, inhibited type I collagen  
CC production by 50-80%

XX
XX      Forming embryonic germ cells useful as model system to study imprinting
PT      involves mating genetically divergent male and female mammal of same
PT      species, dissecting and dissociating embryo obtained from pregnant
PT      mammal.
XX
XX      Disclosure; Page 54; 125pp; English.
XX
XX      The present invention relates to a model system for genomic imprinting
CC      using pluripotent mouse embryonic germ (EG) cell lines derived from an
CC      interspecific cross. Also disclosed is a library containing methylated
CC      CpG islands and a method for assaying methylation in one or more
CC      imprintable genes. The gene imprinting assay is carried out by single-
CC      strand conformation polymorphism (SSCP), quantitative sequencing, single-
CC      nucleotide primer extension or hot stop PCR. The assays are carried out
CC      to determine the post-translational modification of histones. The method
CC      further involves identifying a test substance as a candidate drug for
CC      treating cancer if the test substance enhances as a candidate drug for
CC      imprinting is lost in cancer, or if the test substance inhibits
CC      imprinting of a gene whose imprinting is gained in cancer. The methylated
CC      CpG islands are useful for providing an assessment of the risk of
CC      developing cancer, or for providing diagnostic information relative to
CC      cancer which involves determining the methylation status of the CpG
CC      island in a patient's DNA. The EG cells allow the accession of imprinted
CC      genes which are useful for detecting birth defects, diabetes and cancers
CC      associated with aberrant imprinting. The EG cell lines represent the
CC      first in vitro model system in which genomic imprinting can be followed
CC      dynamically and the two alleles can be distinguished. AAS20953-AAS20969

WPI; 2002-106464/14.

Novel nucleic acid encoding adipose polypeptide which regulates, causes  
or contributes to obesity, useful for treating obesity, heart disease,  
hypertension, infertility, and controlling weight loss in cancer  
patients.

Claim 1; Page 188; 188pp; English.

The invention relates to a nucleic acid encoding a adipose (ADP)  
polypeptide which regulates, causes or contributes to obesity in an  
animal or a human. The polynucleotides, proteins, ant-adp antibodies,  
modulators of adp activity, adp antisense nucleic acids, expression  
vectors, adp transgenic animals are useful in the diagnosis and treatment  
of obesity, adipositas, bulimia, wasting (cachexia), eating disorders  
and/or disorders of body weight/body mass, weight loss due to cancer or  
infectious diseases, genetic disorders associated with hypogonadism e.g.  
Prader-Willi syndrome, Laurence-Moon-Biedl syndrome, hypothyroidism,  
diabetes, Cushing's syndrome, endocrine disorder, hypothyroidism,  
diseases, inflammatory bowel disease, ulcerative colitis, and anorexia  
nervosa. They are also useful for treating disorders of body weight/mass  
e.g. glycogen storage disease, and lipid storage diseases and for  
treating lipomas, and/or liposarcomas. The compositions are also useful  
for treating heart disease, hypertension, and infertility and for  
controlling conditions associated with under weight e.g. enhancing or  
controlling fertility, controlling weight loss in acquired  
immunodeficiency syndrome (AIDS) or cancer patients. The present sequence  
is a PCR primer used to amplify an adp nucleic acid

Novel antisense compound that hybridizes and inhibits nucleic acid  
encoding human glioma-associated oncogene-2, useful for treatment of  
diseases associated with human glioma-associated oncogene-2.

Example 15; Col 47; 43pp; English.

The present invention relates to a new antisense compound targeted to  
human glioma-associated oncogene-2. The invention is useful for  
inhibiting the expression of human glioma-associated oncogene-2 in cells  
or tissues. The invention is also useful for treatment of diseases  
associated with human glioma-associated oncogene-2. The invention is  
further useful for diagnosis, therapeutics, prophylaxis, as research  
reagents and kits, for distinguishing functions of various members of a  
biological pathway, and in antisense gene therapy. The invention is also  
useful prophylactically, e.g., to prevent or delay infection,  
inflammation or tumour formation. The present nucleic acid sequence  
represents an oligonucleotide that was used in the methods of the  
invention to inhibit human glioma-associated oncogene-2

PT Novel antisense compound for treating disease/condition e.g. eosinophilic
PT syndrome or asthma associated with interleukin-5 or IL-5 receptor
PT expression or IL-5 signal transduction, modulates IL-5 signal
PT transduction.
XX
PS Example 23; Page 22; 77pp; English.
XX
CC The invention relates to an antisense compound of 8-30 nucleobases in
CC length, which modulates interleukin (IL)-5 signal transduction. Also
CC include are a pharmaceutical composition comprising the antisense
CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and
CC a diagnostic kit for detecting the expression level of the membrane form
CC versus soluble form of IL-5 receptor a. The antisense compound is useful
CC for modulating IL-5 signal transduction, modulating expression of
CC mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a,
CC in cells or tissues, for altering the ratio of the isoforms of mammalian
CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian
CC having a disease or condition associated with IL-5 signal transduction,
CC IL-5 expression or IL-5 receptor a expression, where the disease or
CC condition include eosinophilic syndrome or asthma. An antisense compound
CC which alters splicing of an RNA encoding IL-5 receptor a is also useful
CC for treating a mammal having a disease or condition. The present sequence
CC is an antisense oligonucleotide targeting mouse IL-5 receptor

PT New antisense oligonucleotide targeted to a nucleic acid encoding
PT vascular endothelial growth factor receptor-1, useful for diagnosing or
PT treating cancer, rheumatoid arthritis, or diseases or conditions
PT involving angiogenesis.
XX
PS Claim 3; Page 83; 150pp; English.
XX
CC The present invention describes a compound (C) 8-50 nucleobases in length
CC targeted to a nucleic acid molecule encoding vascular endothelial growth
CC factor receptor-1 (VEGFR-1), where the compound inhibits the expression
CC of VEGFR-1 and specifically hybridises with the nucleic acid encoding
CC VEGFR-1 or with an 8-nucleobase portion of an active site on the nucleic
CC acid molecule encoding VEGFR-1. Also described: (1) a composition
CC comprising (C) and a carrier or diluent; (2) inhibiting the expression of
CC VEGFR-1 in cells or tissues by contacting the cells or tissues with (C)
CC so that the expression of VEGFR-1 is inhibited; and (3) treating an
CC animal having a disease or condition associated with VEGFR-1 by
CC administering (C) to the animal so that the expression of VEGFR-1 is
CC inhibited. (C) has antiangiogenic, antirheumatic, antiarthritic,
CC cytostatic and antiinflammatory activities, and can be used in antisense
CC gene therapy. The antisense compounds are useful for modulating the
CC expression of VEGFR-1 and for treating diseases or conditions associated
CC with the expression of VEGFR-1, such as hyperproliferative disorders
CC (e.g. cancer), rheumatoid arthritis, or diseases or conditions involving
CC angiogenesis. The antisense compounds are also useful for diagnostic,
CC therapeutic, prophylaxis, e.g. to prevent or delay infection,
CC inflammation or tumour formation, as research reagents and kits, and in
CC distinguishing between functions of various members of a biological
CC pathway. The present sequence represents a human VEGFR-2 chimeric
CC phosphorothioate antisense oligonucleotide, which is used in an example
XX from the present invention

PS Disclosure; SEQ ID NO 6577; 872pp; English.  
XX  
CC The invention relates to a novel pharmaceutical composition, which has a  
CC first active agent comprising an oligonucleotide antisense to the  
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
CC junctions of genes encoding a polypeptide associated with lung and/or  
CC nasal airway dysfunction and a second active agent comprising an  
CC antiinflammatory steroid and ubiquinone. A composition of the invention  
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
CC immunosuppressive, and cytostatic activity. The composition may have a  
CC use in antisense gene therapy. The composition is useful for treating or  
CC preventing a respiratory, lung or malignant disease or condition, also  
CC for enhancing the prophylactic or therapeutic respiratory effect of an  
CC antiinflammatory steroid in a subject, for reducing or depleting levels  
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
CC lung inflammation, lung allergies, or a respiratory disease or condition.  
CC Note: The sequence data for this patent is not represented in the printed  
CC specification, but was obtained in electronic format directly from WIPO

 PT Diagnosing the presence of, or susceptibility to, retinal dystrophy,  
 PT cardiomyopathy, endocrinopathy, diabetes, or Alstrom syndrome in an  
 PT individual, comprises detection or modulation of the ALMS1 protein or  
 PT gene region.  
 XX  
 PS Disclosure; Page 41; 121pp; English.  
 XX  
 CC The present invention describes a method of diagnosing the presence of,  
 CC or susceptibility to, retinal dystrophy, cardiomyopathy, endocrinopathy,  
 CC diabetes, or Alstrom syndrome in an individual. The method comprises  
 CC typing in a sample from the individual the ALMS1 protein or ALMS1 gene  
 CC region of the individual, or detecting aberrant ALMS1 activity. Human  
 CC ALMS1 is located to chromosome 2, more specifically to 2p13. ALMS1 has  
 CC ophtalmological, cardiac, antidiabetic, hepatotropic and nephrotropic  
 CC activities, and can be used in gene therapy. The method is useful for  
 CC diagnosing the presence of, or susceptibility to, retinal dystrophy,  
 CC cardiomyopathy, endocrinopathy (e.g. liver disease or renal impairment),  
 CC diabetes, or Alstrom syndrome in an individual. ALMS1 sequences can be  
 CC used in an agent that prevents or treats retinal dystrophy,  
 CC cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a  
 CC medicament for treating a patient who has been diagnosed as having or  
 CC being susceptible to retinal dystrophy, cardiomyopathy, endocrinopathy or  
 CC diabetes. AC942632 to AC942747 and ABR82113 to ABR82118 represent  
 CC sequences used in the exemplification of the present invention

 PS Claim 15; SEQ ID NO 1311; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cyostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

XX New antisense oligonucleotides targeted to a nucleic acid encoding liver  
PT

```

PT related homologue-1 (LRH1), useful for treating breast cancer,
XX dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
PS Example 15; SEQ ID NO 679; 909pp; English.
XX
CC This invention relates to novel antisense compounds useful for modulating
CC the expression of liver related homologue-1 (LRH1) and splice variants
CC thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC length that target a portion of an active site on the nucleic acid
CC molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC nuclear receptor protein that functions as a tissue specific
CC transcription factor. The present invention describes antisense
CC oligonucleotides that comprise at least one modified internucleoside
CC linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC methylcytidine. These antisense compounds are useful for treating or
CC diagnosing a disease associated with LRH1, such as breast cancer,
CC dyslipidemia, atherosclerosis, low HDL (high density lipoprotein), high
CC LDL (low density lipoprotein), hypercholesterolemia, gall stones,
CC triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC hepatitis, as well as hepatocellular carcinoma or a condition associated
CC with aromatase activity. Accordingly, these compositions exhibit
CC cytostatic, antilipemic, antiarteriosclerotic, anorectic, hepatotropic,
CC litholytic, antiinflammatory and virucidal activities. This
CC oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC expression of the human LRH1 protein of the invention.

PT New antisense compound targeted to a nucleic acid molecule encoding  
 PT Nav1.3, useful for treating a disease or condition associated  
 PT with Nav1.3, e.g. pain, seizure disorder such as childhood seizure  
 PT disorder, or ataxia.  
 XX  
 PS Claim 4; SEQ ID NO 1746; 417bp; English.  
 CC The present invention relates to an antisense compound targeted to a  
 CC nucleic acid molecule encoding Nav1.3, where the antisense compound  
 CC specifically hybridizes with and inhibits the expression of Nav1.3. The  
 CC compound and composition are useful for treating a disease or condition  
 CC associated with Nav1.3, e.g. pain including but not limited to  
 CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,  
 CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,  
 CC pain from burns, migraine headache, cluster headache, mild-to-moderate  
 CC headache; seizure disorder such as childhood seizure disorder, including  
 CC but not limited to neonatal or infantile epilepsy; or ataxia. The present  
 CC sequence represents a chimeric phosphorothioate oligonucleotide with  
 CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of  
 CC human Nav1.3 expression, the oligonucleotides are designed to target  
 CC different regions of the human Nav1.3 RNA.

XX
XX New antisense compound modulating interleukin-5 signal transduction,
PT useful in promoting apoptosis and in treating eosinophilic syndrome or
PT asthma.
XX
XX Example 23; SEQ ID NO 81; 77pp; English.
XX
XX The invention relates to an antisense compound that modulates interleukin
CC -5 (IL-5) signal transduction. The antisense compound is an antisense
CC oligonucleotide targeted to a nucleic acid molecule encoding a mammalian
CC IL-5 or IL-5 receptor a, where the antisense compound modulates the
CC expression of mammalian IL-5 or IL-5 receptor a. The antisense
CC oligonucleotide comprises at least one modified internucleoside linkage,
CC i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one
CC modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at
CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio
CC of the isoforms of mammalian IL-5 receptor a in mammalian cells or
CC tissues comprises contacting the cells or tissues with an antisense
CC compound so that the ratio of the mammalian IL-5 receptor a isoforms is
CC altered. Treating a mammal having a disease or condition associated with
CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a
CC disease or condition characterized by a reduction in apoptosis comprises
CC administering to the mammal a therapeutic or prophylactic amount of an
CC antisense compound so that IL-5 signal transduction, IL-5 or IL-5
CC receptor a expression, or IL-5 receptor a is modulated, the ratio of IL-5
CC receptor a isoforms is altered, or expression of membrane IL-5 receptor a
CC is modulated. The antisense compounds, methods and compositions are
CC useful in promoting apoptosis and in treating eosinophilic syndrome and
CC asthma. This sequence represents a murine IL-5 receptor a DNA antisense
CC oligonucleotide of the invention.

XX
XX Treatment of airway hyper-responsiveness or pulmonary inflammation
PT comprises administering antisense compound having predetermined number of
PT nucleobases targeted to nucleic acid encoding human p38 alpha mitogen-
PT activated protein kinase.
XX
XX Example 12; SEQ ID NO 226; 106pp; English.
XX
XX The invention relates to treating airway hyper-responsiveness or
CC pulmonary inflammation in an individual comprising administering an
CC antisense compound 8-30 nucleobases in length targeted to a nucleic acid
CC molecule encoding a human p38alpha mitogen-activated protein (MAP) kinase
CC to the individual. Also included is a pharmaceutical composition
CC comprising the antisense oligonucleotide in a formulation suitable for
CC intranasal, intrapulmonary or intratracheal administration. Also
CC disclosed are antisense oligonucleotides targeting p38 MAPK beta. The
CC method is useful for treating airway hyper-responsiveness or pulmonary
CC inflammation associated with asthma. The invention provides treatment and
CC diagnosis of diseases through modulation of expression of a gene encoding
CC a p38 mitogen-activated protein kinase. Other diseases associated with
CC p38 MAPK are arthritis, ischemic heart disease (via prevention of
CC apoptosis of cardiac myocytes) and AIDS. The present sequence is a p38
CC MAPK targeting antisense oligonucleotides of the invention.

XX mRNA in specific human tissues.
XX
XX Example 7; Fig 8; 2245pp; Japanese.
XX
XX Primers T41001-T41382 are derived from novel human gene signature (GS)
XX sequences which did not match with sequences deposited in Genbank release
XX 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA
XX libraries prepared from various human tissues; synthesis of cDNA was
XX initiated from the 3'-end of mRNA by using poly(T) as the sole primer.
XX Each library is constructed so as to reflect accurately the relative
XX abundance of different mRNAs in the particular tissue from which it was
XX derived. The appearance frequency of a given GS in a cDNA library can be
XX determined (esp. using primers and probes derived from the GS sequences)
XX as a means of diagnosing abnormal cell function or for recognising
XX different cell types. The primers T41203-4 amplify clone pm1879 which
XX comprises the GS HDWGS001069 (T20069), located on chromosome 20

New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.

PS Claim 1; Page 69; 80pp; English.

XX DNA sequences AAH62100 - AAH62688 represent segments of human genes which  
 CC contain single nucleotide polymorphisms (SNPs). A method is included in  
 CC the invention for analysing a nucleic acid sample, which consists of  
 CC determining the base occupying any one of the polymorphic sites given in  
 CC the SNP containing sequences. The nucleotide sequences can be used in the  
 CC diagnosis or monitoring of diseases, such as cancer, inflammation, heart  
 CC diseases, diseases of the cardiovascular system, and infection by  
 CC microorganisms. The oligonucleotides are also useful in the manufacture  
 CC of a medicament for the treatment or prophylaxis of the diseases, and as

CC a pharmaceutical. SNP containing oligonucleotides are useful in  
 CC applications such as phenotype correlation, forensics, paternity testing,  
 CC medicine and genetic analysis

XX New nucleic acid sequence for manufacturing polypeptides for treating  
 CC endocrine cancers comprises a cDNA encoding a splicing isoform of  
 CC mammalian growth factor receptor (GFR) alpha4.

PS Example 8; Page 62; 143pp; English.

XX The present invention describes an isolated and purified cDNA sequence  
 CC encoding a splicing isoform of a mammalian growth factor receptor  
 CC (GFR) alpha4, or its fragments. GFRalpha4 sequences have cytosolic,  
 CC osteopathic, neuroprotective and anticonvulsant activities. GFRalpha4 is  
 CC a glycosyl-phosphatidylinositol (GPI)-linked glial cell line-derived  
 CC neurotrophic factor (GDNF) family alpha-receptor. A GFRalpha4  
 CC polynucleotide sequence can be used for recording GFRalpha4 mediated  
 CC signalling in neurons or endocrine cells such as thyroid calcitonin-  
 CC producing C-cells, parathyroid gland cells, adrenal chromaffin cells, or  
 CC cells from the pituitary intermediate lobe. GFRalpha4 protein and  
 CC polynucleotide sequences can be used for manufacturing polypeptides  
 CC useful for diagnosing and/or treating tumours in parathyroid gland cells,  
 CC adrenal chromaffin cells, cells of pituitary intermediate lobe,  
 CC pheochromocytoma, parathyroid hyperplasia, neuronal disorders or for  
 CC preventing neuronal death or aberrant axonal sprouting. The present

CC Sequence represents a PCR primer for human GFRA1p4, which is used in an  
CC example from the present invention

PT Generating CDNA molecules using a linked series of multi-cycle primer  
 PT extension reactions, useful for the in vitro replication of nucleic  
 PT acids, in particular for replicating a nucleic acid sequence of interest  
 PT in large quantities.

XX Example 11; SEQ ID NO 70; 54pp; English.

CC The invention describes a process for generating a CDNA molecule from an  
 CC RNA molecule. The method comprises annealing a first primer containing a  
 CC non-replicable element, to an RNA molecule, generating a first strand  
 CC product, separating the first CDNA from its template to produce single  
 CC stranded molecules, annealing a second primer containing a non-replicable  
 CC element, to the first CDNA product, and generating a second CDNA product  
 CC that is a complement of the first CDNA. The first and second primers in  
 CC the process cited above is with or without a cleavable element. The  
 CC methods and compositions are useful for the in vitro replication of  
 CC nucleic acids, in particular for replicating a nucleic acid sequence of  
 CC interest, with large quantities of the desired sequence ultimately  
 CC resulting from the linkage of extension reactions where the sequence of  
 CC interest accumulates in a mathematically linear fashion. This sequence  
 CC represents a non-replicable 1,3 propane diol molecly containing human beta  
 CC -globin primer used in the CDNA amplification method of the invention.

PT Determining cancer cell or predisposition to developing cancer in subject  
 PT candidate for anti-tumor necrosis factor therapy, by determining level  
 PT of expression of B cell activation factor gene in sample of subject.

PS Claim 66; SEQ ID NO 127; 148pp; English.

CC The present invention relates to a method for determining predisposition  
 CC to developing cancer in subject, particularly for a subject having anti-  
 CC tumor necrosis factor (TNF) therapy. The method comprises determining  
 CC the expression level of B cell activation factor (BAFF) gene in a sample,  
 CC where elevated expression of BAFF gene relative to its level of  
 CC expression in healthy subject is indicative of predisposition to  
 CC developing cancer. Also claimed are small interfering RNA (siRNA)  
 CC molecules (ADRE7998-ADRE8125) which antagonizes the expression of a BAFF  
 CC gene. The siRNAs are useful in a method for preventing or delaying the  
 CC development of a cancer in a subject. The invention is also useful for  
 CC treating or preventing diseases such as systemic anaphylaxis or  
 CC hypersensitivity responses, drug allergies (e.g. to penicillin,  
 CC cephalosporins), insect sting allergies, inflammatory dermatoses (e.g.  
 CC dermatitis, eczema, atopic dermatitis, allergic contact dermatitis),

XX
XX Modulating expression of a target gene in a cell, for treating cancer, an
XX immune disease, or a nerve disorder, comprises introducing into the cell
XX a polynucleotide that forms a duplex region with an mRNA transcribed from
XX the target gene.
XX
XX Claim 2; SEQ ID NO 184; 865bp; English.
XX
XX This invention relates to a novel method for modulating the expression of
XX a target gene in a cell. Specifically, it refers to the introduction into
XX of a polynucleotide that forms a duplex region with an mRNA
XX transcribed from the target gene, where the duplex region comprises a
XX mammalian miRNA target region i.e. a non-coding microRNA (miRNA) that
XX regulates mRNA at a post-transcriptional level. The present invention
XX describes a method for controlling ontogenesis of a mammal, function of a
XX mammalian cell, differentiation of a mammalian cell or viability of a
XX mammalian cell in the post-transcriptional phase, which comprises
XX introducing a plasmid vector comprising a promoter and nucleic acid
XX molecule expressing an miRNA or siRNA silencing precursor to the miRNA.
XX Accordingly, it provides a cell therapy method for treating cancer,
XX immune disease, nerve disorder (e.g. amyotrophic lateral sclerosis,
XX Parkinson's disease, or Alzheimer's disease) or an inflammatory disease
XX by introducing into the cell the miRNA, siRNA silencing precursor to the
XX miRNA or the plasmid vector. As such, they can be developed into
XX pharmaceutical compositions that exhibit cytostatic, immunosuppressive,
XX neurotropic, neuroprotective and antiinflammatory activities and hence can
XX be used for immunotherapy. This oligonucleotide sequence is a human miRNA
XX target region derived from a target gene of the invention.

DR New zinc finger-containing proteins and nucleic acids, useful in
PT manufacturing a medicament for treating or preventing a disorder
PT associated with decreased or increased expression or activity of MD23,
PT MD24, MD27 or MD212, e.g. cancer.
XX
PS Example 8; SEQ ID NO 4668; 103pp; English.
XX
CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is
CC encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2,
CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome
CC 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder,
CC associated with decreased or increased expression or activity of MD23,
CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

```

```

XX
XX The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides; a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and/or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

XX New nucleic acid molecule that down-regulates expression of Grb2-related  
PT with insert domain (GRID) gene, useful for treating a condition  
PT associated with the level of GRID, e.g. tissue/graft rejection and  
PT leukemia.

XX Claim 4; SEQ ID NO 383; 74pp; English.

XX The invention relates to a nucleic acid molecule that down-regulates  
CC expression of Grb2-related with insert domain (GRID) gene, e.g. a  
CC hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNazyme,  
CC amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell  
CC including the novel nucleic acid molecule, reducing GRID activity in a  
CC cell by contacting the cell with the novel nucleic acid molecule,  
CC treating a patient having a condition associated with the level of GRID  
CC (e.g. tissue/graft rejection or leukaemia) by contacting the cell with  
CC the novel nucleic acid molecule, cleaving RNA of a GRID gene by  
CC contacting the cell with the novel nucleic acid molecule, an expression  
CC vector comprising a nucleic acid sequence (encoding at least the novel  
CC nucleic acid molecule in a manner that allows its expression), a  
CC mammalian cell including the expression vector and an enzymatic nucleic  
CC acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid  
CC molecule is useful for treating a condition associated with the level of  
CC GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is  
CC a target region for the enzymatic nucleic acids of the invention.

XX Novel method for typing HLA DOB1 alleles - for tissue typing, determining  
PT identity, and for studying disease susceptibility.

PS Disclosure; Page 30; 37pp; English.

XX The sequences given in AAQ26461-81 are probes which were used within the  
CC scope of the invention to type class II HLA DOB1 alleles. These probes  
CC were used to screen sequences amplified from the DOB1 gene second exon  
CC sequence. This method could be used to identify new DOB1 alleles. This  
CC method provides a simple, rapid and precise system for DOB1 typing,  
CC including those alleles which cannot be distinguished by serological  
CC methods. The presence or absence of a particular HLA DOB1 allele serves  
CC as an indicator of susceptibility to insulin-dependent diabetes mellitus  
CC (IDDM). Accurate DO typing is particularly important in the field of  
CC organ transplantation and in the study of the molecular basis of disease  
CC susceptibility. Moreover, samples from unusual sources, eg. ancient DNA  
CC or forensic samples, can be typed, even when the DNA sample is degraded  
CC (field.)

 PS Disclosure; Page 34; 71pp; English.  
 XX  
 XX AAV20965-V20991 are PCR primers used in the construction of a novel  
 CC fusion protein constructed from a papillary renal cell carcinoma (PRCC)  
 CC associated protein and the transcription factor TFE3 which is used in a  
 CC method for the diagnosis, prophylactic and therapeutic treatment of  
 CC papillary renal cell carcinoma. The translocation t(X;1) (p11.2;q21.2)  
 CC found in PRCC results in a fusion of the TFE3 gene with a new chromosome  
 CC 1 gene designated PRCC (at 1q21.2), resulting in expression of a fusion  
 CC protein between the N-terminus of PRCC and almost the whole of the TFE3  
 CC gene. Normal TFE3 transcripts are no longer produced. Two other fusion  
 CC partners for TFE3 have also been detected; Nono, from a invx (p11.2; q13-  
 CC 24 or 12) translocation and the PSF splice factor gene, resulting in t(X;  
 CC 1) (p11.2;p34). These trans-locations define a subgroup of PRCC generally  
 CC encountered in patients younger than 25

Genetic diagnosis of bovine Chediak-Higashi syndrome.

Example 1; Page 7; 23pp; Japanese.

The present invention describes a method for the genetic diagnosis of

bovine Chediak-Higashi syndrome (CH-S). The method comprises getting a

bovine nucleic acid sample, subjecting it to a gene amplifying reaction

and examining the mutation on the nucleic acid fragment. The method can

be used for an easy rapid detection of bovine CH-S and its carrier. The

present sequence represents a PCR primer for the bovine lysosomal traffic

regulator (Lyst) gene nucleotide sequence, which is related to CH-S

sample.

Claim 7; SEQ ID NO 386; 16pp; English.

The present invention describes a molecular sub-typing system (S) for

Escherichia coli, which comprises observing and recording variable number

tandem repeats (VNTR) repeat arrays in an E. coli DNA sample. Also

described: (1) VNTR loci (I) for sub-typing E. coli O157:H7; (2) primers

(II) for amplifying (I); (3) amplicon comprising (II) and a locus

comprising a VNTR sequence from E. coli O157:H7; (4) multiplex cocktail

(III) for multiplex amplification of (I) comprising two or more primers

of (II); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR

comprising primers for VNTR loci in E. coli, and amplifying reagents for

maintaining hybridisation and amplification condition in a PCR instrument

with DNA from an E. coli strain; (6) kits for molecular sub-typing of E.

coli O157:H7 strains by multiplex, comprising (III), and amplifying

reagents for maintaining hybridisation and amplification condition in a

multiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub

-typing (MI) an E. coli strain, comprising: (a) obtaining one or more

primers for amplifying loci comprising VNTR, where the primers have an

observable indicator; (b) obtaining single-stranded sample DNA from the

E. coli sample to be subtyped; (c) combining the primers, the sample DNA

and amplifying reagents under hybridising and amplifying conditions in a

PCR instrument to form amplicons comprising the primers and the VNTR; (d)

separating the amplicons by size; (e) evaluating numbers and sizes of

separated amplicons; and (f) comparing the evaluation to an evaluation of

amplicons obtained by PCR from a known E. coli strain. MI is useful for

producing discrete genetic data for an epidemiological database. (I) is

useful as a research tool. (S) is useful for subtyping pathogenic E.

coli. The present sequence represents an E. coli VNTR loci-related

 XX Molecular sub-typing system for Escherichia coli, comprises observing and  
 PT recording variable number tandem repeat arrays in an Escherichia coli DNA  
 sample.  
 PT  
 XX  
 PS Claim 7; SEQ ID NO 385; 166pp; English.

The present invention describes a molecular sub-typing system (S) for  
 CC Escherichia coli, which comprises observing and recording variable number  
 CC tandem repeats (VNTR) repeat arrays in an E. coli DNA sample. Also  
 CC described: (1) VNTR loci (I) for sub-typing E. coli 0157:H7; (2) primers  
 CC (II) for amplifying (I); (3) amplicon comprising (II) and a locus  
 CC comprising a VNTR sequence from E. coli 0157:H7; (4) multiplex cocktails  
 CC (III) for multiplex amplification of (I) comprising two or more primers  
 CC of (II); (5) kits for molecular sub-typing of E. coli 0157:H7 by PCR  
 CC comprising primers for VNTR loci in E. coli, and amplifying reagents for  
 CC maintaining hybridisation and amplification condition in a PCR instrument  
 CC with DNA from an E. coli strain; (6) kits for molecular sub-typing of E.  
 CC coli 0157:H7 strains by multiplex, comprising (III), and amplifying  
 CC reagents for maintaining hybridisation and amplification condition in a  
 CC multiplex instrument with DNA from an E. coli 0157:H7 strain; and (7) sub-  
 CC -typing (M1) an E. coli strain, comprising: (a) obtaining one or more  
 CC primers for amplifying loci comprising VNTR, where the primers have an  
 CC observable indicator; (b) obtaining single-stranded sample DNA from the  
 CC E. coli sample to be subtyped; (c) combining the primers, the sample DNA  
 CC and amplifying reagents under hybridising and amplifying conditions in a  
 CC PCR instrument to form amplicons comprising the primers and the VNTR; (d)  
 CC separating the amplicons by size; (e) evaluating numbers and sizes of  
 CC separated amplicons; and (f) comparing the evaluation to an evaluation of  
 CC amplicons obtained by PCR from a known E. coli strain. M1 is useful for

CC producing discrete genetic data for an epidemiological database. (1) is  
CC useful as a research tool. (S) is useful for subtyping pathogenic E.  
CC coli. The present sequence represents an E. coli VNR1 loci related  
CC amplicon sequence which is used in the exemplification of the present  
CC invention.

PT Determining polynucleotide sequence differences by amplifying  
PT polynucleotide in presence of labeled nucleotide and detecting variation  
PT based on incorporation frequency of labeled nucleotide compared to known  
PT reference frequency.

PS Disclosure; SEQ ID NO 2; 52pp; English.

CC The invention relates to compositions, kits and methods for detecting  
CC polynucleotide sequence differences. The method involves amplifying the  
CC polynucleotide of interest in the presence of a labelled nucleotide and  
CC detecting variation based on incorporation frequency of labelled  
CC nucleotide compared to known reference frequency. The method is useful  
CC for determining a sequence difference such as a single nucleotide  
CC polymorphism (SNP) or a tandem repeat, between a region of interest in a  
CC polynucleotide and a reference sequence. It is useful for determining the  
CC presence of a mutation in a region of interest in a polynucleotide and is  
CC also useful for genotyping. The present sequence is an allelic  
CC oligonucleotide used in polynucleotide sequence detection.

 PS Example 7; Page 53; 70pp; English.  
 XX  
 CC The present invention relates to an oligonucleotide array comprising  
 CC oligonucleotide tags fixed to a solid substrate. The oligonucleotide  
 CC array is useful for genotyping a nucleic acid sample at one or more loci  
 CC via single base extension (SBE) reactions. A pair of primers is used to  
 CC amplify a polymorphic locus in a sample e.g. a single nucleotide  
 CC polymorphism (SNP). The present sequence is one of the primers used in  
 CC the method of the present invention to amplify a polymorphic sample. The  
 CC amplified nucleic acid product is then used as a template in a SBE  
 CC reaction with an extension primer. The SBE reaction products are used to  
 CC form the oligonucleotide array

 PT In vivo homologous sequence targeting in eukaryotic cells - using a  
 PT targeting polynucleotide and recombinase to deliver agents or alter  
 PT genes.  
 XX  
 PS Example 3; Page 61; 100pp; English.  
 XX  
 CC Two primers (AAQ51566, AAQ51567) were used to amplify a 491 base pair  
 CC fragment of the cystic fibrosis transmembrane conductance regulator

CC (CFTR) gene. This fragment was then used as a targeting polynucleotide  
 CC for the correction of a human CFTR disease allele (delta F508 mutation).  
 CC The targeting method can also be used to target chemical substrates, e.g.  
 CC drugs, in a sequence specific manner in-vivo, to correct or generate  
 CC genetic mutations in endogenous DNA sequences by homologous recombination  
 CC and/or gene conversion, or to produce homologously targeted transgenic  
 CC animals at high efficiency. (Updated on 25-MAR-2003 to correct PN field.)

XX Detection of allele specific mutation(s) and differentiation in gene  
 PT expression - for assessment of gene therapy used in correction of genetic  
 PT disorders e.g. cystic fibrosis.

PS Claim 9; Page 23; 79pp; English.

XX A novel method has been developed for the detection of allele specific  
 CC mutations and for differentiation between gene expression of a mutated  
 CC tissue or cells and a normal non-mutated tissue. The method involves: (a)  
 CC obtaining a sample from the same type of each of the mutated and non-  
 CC mutated tissue or cells; (b) fixing the cells; (c) digesting the cells to  
 CC expose single stranded mRNA and to eliminate DNA contained in the cells;  
 CC (d) subjecting the mRNA to reverse transcription reaction conditions to  
 CC obtain first strand cDNA from the mRNA template; and (e) subjecting the  
 CC cDNA to polymerase chain reaction (PCR) to obtain the cDNA in sufficient  
 CC quantities for assay, where the amplification is performed in the  
 CC presence of allele-specific and allele-non-specific primers, using a  
 CC solution comprising at least one non-interfering labelled nucleotide  
 CC marker detectable by spectroscopic, autoradiographic, immunocytochemical  
 CC or enzymatic detection means. The present sequence represents a  
 CC specifically claimed allele-specific primer. The method may be used for  
 CC detection of a mutation which causes cystic fibrosis, Fanconi's anaemia,  
 CC sickle cell anaemia, retinitis pigmentosa, xeroderma pigmentosa, ataxia  
 CC telangiectasia, Bloom's syndrome, retinoblastoma, Duchenne's muscular  
 CC dystrophy or Tay-Sachs's disease. It may also be useful for qualitative  
 CC and quantitative assessment of the success of a gene therapy of these  
 CC diseases

XX
XX Determining presence or absence of a predetermined endogenous nucleic
XX acid sequence by using an enzyme that depolymerizes the 3' end of an

```

```

PT oligonucleotide probe hybridized to a target sequence to release
PT identifier nucleotides.
XX
XX Example; Page 324; 389pp; English.
XX
XX The present invention describes a method (M1) for determining the
XX presence or absence of a predetermined endogenous nucleic acid target
XX sequence (ENAT). The method comprises hybridising a probe having an
XX identifier nucleotide (IN) with ENAT which is treated with an enzyme that
XX depolymerises the 3' end of hybridised NA to release the INs. M1 is used
XX for determining the number of known sequence repeats present in a nucleic
XX acid target sequence in a nucleic acid sample. The method is also useful
XX for determining whether a nucleic acid target sequence in a sample is an
XX allele from a homozygous or heterozygous locus. The method is also useful
XX for detection of mutations, translocations and SNPs in nucleic acids
XX (including those associated with genetic disease), determination of viral
XX load, species identification, sample contamination, and analysis of
XX forensic samples. AAH86791 to AAH87079 and AAH12817 represent sequence
XX which are used in the exemplification of the present invention. N.B.
XX There is a discrepancy between the SEQ ID NO: and sequences given in the
XX examples, and the SEQ ID NO: and sequences given in the sequence listing
XX from the present invention

 XX Map of wheat D genome comprising the genome location of a microsatellite  
 PT marker, useful for e.g. identifying genes responsible for a desired  
 PT phenotypic trait, especially quantitative trait loci in wheat, and  
 PT diseases.  
 XX  
 PS Claim 4; Page 4; 105pp; English.  
 XX  
 CC The invention relates to a map of the bread wheat D genome comprising the  
 CC genome location of a microsatellite marker selected from a group of 185  
 CC such markers (ABQ92733-ABQ92917). The invention also encompasses the use  
 CC of left (ABQ92918-ABQ93102) and right (ABQ93103-ABQ93287) primers to  
 CC amplify and detect the microsatellite markers, and to identify genes  
 CC responsible for a phenotypic trait of interest in wheat. Wheat is an

CC allohexaploid species consisting of 3 diploid genomes designated A, B and  
 CC D, resulting from two successive intercrossings involving at least three  
 CC different species. The D genome is thought to have been introduced in the  
 CC most recent intercrossing, between the amphiploid AABB and Triticum  
 CC tauschii (DD), probably involving only a limited number of genotypes of  
 CC both species. Due to its polyploid genome, the large size of its genome,  
 CC and its low level of polymorphism, the genetic mapping of wheat has to  
 CC date been difficult. Microsatellites are tandemly repeated sequences  
 CC between one and six nucleotides long, and are very polymorphic in length,  
 CC mainly due to polymerase slippage during replication. This high degree of  
 CC polymorphism makes them especially suitable for the genetic mapping of  
 CC species which show little intraspecies polymorphism, such as wheat. In  
 CC addition, microsatellites are codominant, and exhibit Mendelian  
 CC inheritance. The 185 microsatellite markers of the invention are  
 CC developed from the ancestral diploid donor species Triticum tauschii and  
 CC map to the wheat D genome, which is less polymorphic than the A or B  
 CC genomes. These microsatellite markers thus help to overcome some of the  
 CC problems associated with the genetic mapping of wheat. The wheat D genome  
 CC map and the microsatellite markers and associated primers of the  
 CC invention are useful for identifying genes responsible for a phenotypic  
 CC trait of interest, most notably QTLs (quantitative trait loci). In  
 CC particular they may be used for analysing genes and alleles implicated in  
 CC disease and for identifying development factors, quality factors and  
 CC factors conferring resistance to pathogens and xenobiotics. The  
 CC microsatellite markers, and associated primers may be also be used in  
 CC mapping and genotyping diploid and polyploid species of Triticum,  
 CC particularly Aegilops, Triticum monococcum, Triticum durum, Triticum  
 CC aestivum, or related species; for identifying cultivars and hybrids of  
 CC Triticum and related species; to assess whether or not a product  
 CC comprises wheat or a related species; and to assess whether or not a  
 CC product comprises genetically modified wheat. The present sequence  
 CC represents a specifically claimed Triticum tauschii/wheat genome D  
 CC microsatellite marker left PCR primer of the invention. (Updated on 29-

XX PT
XX New compound that hybridizes with and inhibits the expression of
XX PT Phospholipase A2, group IIA, useful for preparing a composition of
XX PT treating or preventing inflammation, cancer, psoriasis or diabetes.
XX PS
XX Example 13; Page 83; 135pp; English.
XX CC
XX The present invention describes a compound (I) comprising 8-50
XX CC nucleobases which is targeted to a 5' untranslated region (UTR), coding,
XX CC 3' UTR or intron region of a nucleic acid molecule encoding phospholipase
XX CC A2, group IIA (synovial), where the compound specifically hybridizes with
XX CC and inhibits the expression of phospholipase A2, group IIA (synovial).
XX CC Also described: (1) a composition comprising the compound and a carrier
XX CC or diluent; (2) a method of inhibiting the expression of phospholipase
XX CC A2, group IIA in cells or tissues; and (3) a method of treating an animal
XX CC having a disease or condition associated with phospholipase A2, group IIA
XX CC (synovial). (I) has antiinflammatory, antidiabetic, cytostatic and
XX CC antipsoriatic activities, and can be used in vaccines and in gene
XX CC therapy. The compound (I) can be used for preparing a composition for
XX CC treating or preventing inflammation, cancer, psoriasis or diabetes. The
XX CC present sequence represents a PCR primer for human phospholipase A2 group
XX CC IIA (synovial), which is used in an example from the present invention

XX Rapid, sensitive detection of specific or unspecified microbes causing
XX PT diarrhea and food poisoning, using primers which target universal and
XX PT specific genes, and amplifying by PCR under heat cycle conditions
XX PT suitable for many detections.
XX PS
XX Claim 1; SEQ ID NO 195; 69pp; Japanese.
XX
XX The present invention relates to a method for detecting microorganisms
XX CC using primers (ADP90918-ADP91145). The method is used for detecting
XX CC microorganisms (bacteria, fungi, protozoa, viruses) which cause diarrhoea
XX CC symptoms, and pathogenic microbes of food poisoning. The method can be
XX CC used to detect unspecified microbes, or specific pathogens, or for the
XX CC simultaneous detection of many kinds of microorganism.

PT Pharmaceutical composition for treating ailments associated with impaired  
PT respiration, has oligo(s) antisense to specific gene(s) or its  
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
PT ubiquinone.  
XX  
PS Disclosure; SEQ ID NO 13632; 872pp; English.  
XX  
CC The invention relates to a novel pharmaceutical composition, which has a  
CC first active agent comprising an oligonucleotide antisense to the  
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
CC junctions of genes encoding a polypeptide associated with lung and/or  
CC nasal airway dysfunction and a second active agent comprising an  
CC antiinflammatory steroid and ubiquinone. A composition of the invention  
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
CC immunosuppressive, and cytostatic activity. The composition may have a  
CC use in antisense gene therapy. The composition is useful for treating or  
CC preventing a respiratory, lung or malignant disease or condition, also  
CC for enhancing the prophylactic or therapeutic respiratory effect of an  
CC antiinflammatory steroid in a subject, for reducing or depleting levels  
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
CC lung inflammation, lung allergies, or a respiratory disease or condition.  
CC Note: The sequence data for this patent is not represented in the printed  
CC specification, but was obtained in electronic format directly from WIPO

CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, allergies and/or surfactant hypoproduction are associated
CC inflammation, allergies and/or bronchoconstriction and/or lung
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT related homologue-1 (LRH1), useful for treating breast cancer,
PT dyslipidaemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS Example 15; SEQ ID NO 438; 909pp; English.
XX
CC This invention relates to novel antisense compounds useful for modulating
CC the expression of liver related homologue-1 (LRH1) and splice variants
CC thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC length that target a portion of an active site on the nucleic acid
CC molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC nuclear receptor protein that functions as a tissue specific
CC transcription factor. The present invention describes antisense
CC oligonucleotides that comprise at least one modified internucleoside
CC linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC methylcytidine. These antisense compounds are useful for treating or
CC diagnosing a disease associated with LRH1, such as breast cancer,
CC dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC hepatitis, as well as hepatocellular carcinoma or a condition associated
CC with aromatase activity. Accordingly, these compositions exhibit

```

CC cytosolic, antilipemic, antiarteriosclerotic, anorectic, hepatotropic,  
CC litholytic, antiinflammatory and virucidal activities. This  
CC oligonucleotide sequence is an antisense DNA oligo used to modulate the  
CC expression of the human LRH1 protein of the invention.

XX
XX Salonen JT, Tuomainen T, Pirkkanen M;
XX
XX WPI; 2004-347978/32.
XX
XX Detecting risk of cardiovascular disease by detecting mutations in genes
XX encoding alpha2b-adrenoreceptors and apolipoprotein B.
XX
XX Disclosure; SEQ ID NO 2; 42pp; English.
XX
XX This invention relates to a novel method for detecting genetic variations
XX or polymorphisms in genes related to cardiovascular disease.
XX Specifically, it refers to the identification of a mutation in the genes
XX encoding alpha2b-adrenoreceptor and apolipoprotein B, as well as a
XX mutation in at least one of the genes encoding dimethylarginine
XX dimethylaminohydrolase 1, fibrinogen-beta, natriuretic peptide precursor
XX A, neurotensin Y, cystathione beta synthase, glycoprotein IIb/IIIa or
XX lipoprotein lipase. The present invention describes that detecting a
XX mutation in at least three of these genes can be used diagnostically to
XX indicate an increased risk of coronary heart disease and/or myocardial
XX infarction (MI). The method further comprises combining information
XX concerning age, gender, the family history of cardiovascular diseases and
XX hypercholesterolaemia and the medical history concerning cardiovascular
XX diseases of the subject with the results obtained from the method above
XX for confirming the indication obtained from the detection step. This
XX oligonucleotide sequence is a PCR primer used to detect a specific
XX mutation in human apolipoprotein B (APOB), given in an exemplification of
XX the invention.

XX Targeting and altering by homologous recombination, a pre-selected target
PT DNA sequence in a eukaryotic cell to make a targeted sequence
PT modification by introducing into eukaryotic cell, a recombinase and
PT targeting polynucleotide.
XX
XX Example 3; Page 18; 31pp; English.
XX
CC The present invention relates to a method for targeting and altering by
CC homologous recombination, a pre-selected target DNA sequence in a
CC eukaryotic cell to make a targeted sequence modification. The method
CC comprises introducing into at least one eukaryotic cell at least one
CC recombinase and at least one targeting polynucleotide having a homology
CC clamp that substantially corresponds to or is substantially complementary
CC to a pre-selected target DNA sequence. Also disclosed are: a composition
CC for producing a targeted modification of an endogenous DNA sequence, a
CC kit for therapy, monitoring or prophylaxis of a genetic disease
CC comprising a recombinase and a targeting polynucleotide, a method for
CC administering to the animal the composition consisting essentially of a
CC targeting polynucleotide for correcting the disease allele and a
CC recombinase, and an animal comprising an allele that has been corrected
CC according to the method cited above. The targeted sequence modification
CC comprises a deletion or addition of at least one additional nucleotide.
CC The targeted sequence modification corrects a human disease allele (e.g.
CC CPTFR, p53) in a human cell. The recombinase and the targeting
CC polynucleotide are introduced into the eukaryotic cell simultaneously by
CC a method selected from microinjection, electroporation, or contacting of
CC the cell with a lipid-protein-targeting polynucleotide complex. The
CC method is useful for targeting and altering by homologous recombination,
CC a pre-selected target DNA sequence in a eukaryotic cell to make a
CC targeted sequence modification. The present sequence represents a PCR
CC primer used in the examples of the present invention.

XX
XX New antisense oligonucleotides for modulating CDC14A expression, useful
PT for diagnosing, preventing or treating diseases or conditions associated
PT with CDC14A, such as a hyperproliferative disorder, particularly cancer.
XX
XX Example 15; SEQ ID NO 13; 49pp; English.
XX
CC The invention relates to a compound targeted to a nucleic acid molecule
CC encoding the human CDC14A polypeptide. The compound is an antisense
CC oligonucleotide that specifically hybridizes with the nucleic acid and
CC inhibits expression of the polypeptide. The antisense oligonucleotide
CC comprises at least one modified internucleoside linkage i.e. a
CC phosphorothioate linkage, at least one modified sugar moiety, preferably
CC a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase
CC comprising a 5-methylcytosine. The antisense compounds are useful for
CC modulating the expression of the human CDC14A polypeptide and in
CC preparation of a composition for treating hyperproliferative disorders,
CC e.g. cancer. This sequence represents an antisense oligonucleotide of the
CC invention.

DR  WPI; 2004-293804/27.
XX
XX Novel single or multiple target oligonucleotide anti-sense to e.g.
PT initiation codon, intron of respiratory disease-relevant gene e.g. CCR1,
PT RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
PT asthma.
XX
XX Claim 2; SEQ ID NO 1325; 174pp; English.
XX
XX The invention relates to oligonucleotides anti-sense to an initiation
CC codon, coding region, 5' or 3' intron-exon junction, intron or region
CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC -5 receptor, CCR1, CCR3, Boraxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC trypsinase a, trypsinase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC also relates to a method of screening a candidate compound that binds to
CC one or more nucleic acid target(s) or expressed product(s), for the
CC prevention and/or treatment of a respiratory or lung disease. The
CC oligonucleotides are useful for reducing or inhibiting expression of a
CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC CCR1, CCR3, Boraxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
CC trypsinase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC useful for preventing or treating a respiratory or lung disease. The
CC respiratory or lung disease is associated with hyper-responsiveness to
CC and/or increased levels of, adenosine and/or levels of adenosine A
CC receptor(s), and/or asthma and/or lung allergies associated with
CC inflammation or an inflammatory disease. The respiratory or lung disease
CC is chosen from airway inflammation, allergy, asthma, impeded respiration,
CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC hypertension, lung inflammation, bronchitis, airway obstruction or
CC bronchoconstriction. This sequence represents an oligonucleotide of the
CC invention.

New antisense oligonucleotides useful for modulating expression of Farnesoid X Receptor (FXR) or for treating diseases associated with FXR, e.g., diabetes, immunological disorders, cardiovascular disorders, gallstones or obesity.

Claim 4; SEQ ID NO 1955; 150pp; English.

The invention relates to an antisense compound 8-30 nucleobases in length

CC	targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR),
CC	where the antisense compound specifically hybridizes with and inhibits
CC	the expression of FXR. The composition and methods are useful for
CC	inhibiting the expression of FXR (Farnesoid X receptor) in cells or
CC	tissues, or for treating diseases or conditions associated with FXR, such
CC	as diabetes, immunological disorders, cardiovascular disorders, e.g.,
CC	dyslipidemia and its symptoms, atherosclerosis, low HDL (high density
CC	lipoprotein), elevated LDL (low density lipoprotein) or obesity,
CC	hypercholesterolemia, gallstones, hypertriglyceridemia, or neurologic
CC	neurological disorders, or ischemia/reperfusion injury. In addition, the
CC	composition is used for diagnostics, prophylaxis, or as research reagent
CC	or kits. This sequence corresponds to an antisense oligonucleotide of the
CC	invention.

DR
XX
XX      Assay of a target comprises incubation of a hybridization mixture
PT      comprising a target composition and a probe composition, and detecting a
PT      signal correlated with the binding affinity of the probe.
XX
XX      Example 1; SEQ ID NO 2; 24pp; English.
XX
XX      The invention relates to a method for assaying a target comprising
CC      providing a target composition, a probe composition and a hybridisation
CC      mixture, incubating the hybridisation mixture to bind the target sequence
CC      to the probe sequence to provide a complex, and detecting a signal
CC      correlated with a binding affinity of the probe for the target. The assay
CC      is useful for enhancing the sensitivity of any method for assaying
CC      interactions between nucleobase-containing sequences (canonical
CC      interactions between nucleobase-containing probes and targets to form
CC      antiparallel Watson-Crick duplexes). This sequence represents a PCR
CC      primer used to amplify a region of exon 10 of the human cystic fibrosis
CC      gene, used in the scope of the invention.

XX      New oligonucleotide compound that inhibits expression of DRAK2, useful
XX      for preparing a composition for treating hyperproliferative disorder,
XX      e.g., cancer.
XX      Example 15; SEQ ID NO 84; 87pp; English.
XX      The invention relates to a new compound (e.g. an antisense
XX      oligonucleotide), having a sequence comprising 8-80 bp targeted to a
XX      nucleic acid encoding DRAK2 (death-associated protein kinase-related
XX      apoptosis-inducing protein kinase 2, also known as serine/threonine
XX      kinase 17B, STK17B), specifically hybridises with the nucleic acid
XX      encoding DRAK2 (appearing as ADE8859 and representing bases 58695-149492
XX      of human chromosome 2) and inhibits expression of DRAK2. Also included
XX      are inhibiting the expression of DRAK2 in cells or tissues, screening for
XX      a modulator of DRAK2, a diagnostic method for identifying a disease
XX      state, a kit or assay device comprising the compound and treating an
XX      animal having a disease or condition associated with DRAK2. The
XX      oligonucleotide compound is useful for preparing a composition for
XX      treating hyperproliferative disorders, degenerative disorders,
XX      neurological disorders, Alzheimer's disease, Parkinson's disease,
XX      Amyotrophic lateral sclerosis (ALS), retinitis pigmentosa, blood cell
XX      disorders, cancer, autoimmune disorders and viral infection. The present
XX      sequence represents an antisense oligonucleotide targeting DRAK2.

XX      (TEXA ) UNIV TEXAS.
XX      Barbour AG, Bunnoc V;
XX      WPI; 1992-268660/32.
XX      New flagella-less Borrelia and derived antigens - useful for vaccinating
XX      against and diagnosing Borrelia infections e.g. Lyme disease or relapsing
XX      fever.
XX      Disclosure; Page 14; 88pp; English.
XX      The sequence shows a synthetic probe having a sequence based on a
XX      conserved sequence of Borrelia burgdorferi flagellin gene (fla gene) of
XX      two other strains of B. burgdorferi. The probe was used to screen a
XX      genomic library of strain HB19 of B. burgdorferi in lambda FIX II to
XX      obtain the DNA sequence encoding the flagellar protein of B. burgdorferi.
XX      The fla gene may be mutagenised to form an inactive fla gene e.g. by
XX      deletion of the entire coding region, or mutagenesis of the RBS, etc. so
XX      that functional flagellar protein is not produced. This mutated gene may
XX      be reintroduced into Borrelia species and cultures of flagellless
XX      Borrelia microbes produced. Antigens to the flagellless Borrelia sp. and
XX      vaccines can be used for thr prevention and treatment of Lyme disease,
XX      epidemic bovine abortion, avian spirochetosis or relapsing fever. Since
XX      the transformed microorganism lacks the flagella antigen associated with
XX      autoantibody, it can be used to immunise individuals against Lyme disease
XX      without the risk of vaccine induced autoantibody formation. See also
XX      AAQ27078. (Updated on 25-MAR-2003 to correct PN field.)

XX
XX Detection of early onset, non-insulin dependent diabetes mellitus - by
XX detecting a mutation in a glucokinase gene or prod., esp. for maturity
XX onset diabetes of the young.
XX
XX Example 7; Page 31; 60pp; English.
XX
XX The sequences given in AAQ51045-79 are primers which were used in the
XX detection of restriction fragment length polymorphisms (RFLPs) within the
XX human adenosine deaminase gene (ADA), beta-cell glucose transporter gene
XX (GLUT2) and the human glucokinase gene. The glucokinase gene maps to a
XX locus on the short arm of chromosome 7 and mutations within this gene
XX show some correlation with certain forms of non-insulin dependant
XX diabetes mellitus (NIDDM), esp. maturity-onset diabetes of the young
XX (MODY). The polymorphic AluVPA region of ADA cosegregates with one gene
XX responsible for MODY and has been mapped to the long arm of chromosome
XX 20. Glucokinase is an enzyme which catalyses the formation of glucose-6-
XX phosphate from glucose and may be involved in the regulation of insulin
XX secretion and integration of hepatic intermediary metabolism. Nonsense
XX and missense mutations within the glucokinase gene (see also AAQ51038-44)
XX may be identified by the method of the invention. Early onset NIDDM is
XX examined by detecting at least one single nucleotide change in a portion
XX of the gene. The DNA is isolated and a pair of primers are selected which
XX are capable of amplifying an exon of the gene via PCR. The single
XX nucleotide changes are identified in the amplification product. (Updated
XX on 25-MAR-2003 to correct PN field.)

XX CC
XX CC The present invention describes a recombinant human immunodeficiency type
XX CC 1 virus (HIV-1) having a variation in the predetermined base in the
XX CC region encoding for viral protease in comparison to HIV genome gene
XX CC cloned in HIV-1 molecular clone pNL4-3, and having a (+) chain RNA genome
XX CC with modifications of A at 2591st gene of the HIV genome into C, and A at
XX CC 2594th into G, and a modified amino acid sequence corresponding to
XX CC modified base in the region encoding for the virus derived protease, and
XX CC optionally having a recombinant HIV-1 molecular clone with a plasmid
XX CC composed of the same base sequence with that of the molecular clone pNL4-
XX CC 3 in the residual base sequence. Also described are: (1) the plasmid of
XX CC pNL-Sma2 and pNL-delta-Pro2. The recombinant HIV-1 molecular clones can
XX CC be used for reliable assessment of drug resistance with the recombinant
XX CC HIV-1. AA221352 to AA221392 represent primers used in the exemplification
XX CC of the present invention

XX New vertebrate slit protein - useful for diagnosis and treatment of

PT cancers in nerves, muscle and endocrine system.

XX Disclosure; Page 89; 102pp; Japanese.

CC The invention relates to a vertebrate-derived protein containing an amino  
CC acid sequence shown in AAY27137 and AAY27139. The vertebrate-derived  
CC protein has at least 55 % homology to one of sequences shown in AAY27141-  
CC Y27144, and has slit protein-like activity. The vertebrate slit proteins  
CC encoding nucleic acid sequences have at least 60% homology to nucleic  
CC acid sequences AAK89161-163. The vertebrate-derived proteins can be  
CC produced recombinantly by transforming host cells with expression vectors  
CC comprising the encoding nucleic acids. The proteins of the invention are  
CC for diagnosing and treating cancer of the nerves, muscle and/or endocrine  
CC system

PT Inhibiting gene expression e.g. DNA methyltransferase, by treating cells  
PT with a synergistic amount of antisense oligonucleotide and protein  
PT effectors e.g. 5-aza-cytidine of gene products, useful for gene therapy  
PT of e.g. tumors.

XX Disclosure; Page 25; 99pp; English.

CC The present invention describes a method for inhibiting the expression of  
CC a gene in a cell comprising contacting the cell with an effective  
CC synergistic amount of an antisense oligonucleotide which inhibits  
CC expression of the gene, and an effective synergistic amount of a protein  
CC effector of a product of the gene. Also described are: (1) a method for  
CC treating a disease responsive to inhibition of a gene in a mammal; (2) a  
CC method for inhibiting tumour growth in mammal; (3) an inhibitor of a gene  
CC comprising an antisense oligonucleotide which inhibits expression of the  
CC gene in operable association with a protein effector of a gene product;  
CC and (4) a pharmaceutical composition comprising the inhibitor of (3). The  
CC methods and compositions are useful as analytical tools for transgenic  
CC studies and as therapeutic tools, e.g. as gene therapy tools for human  
CC diseases including benign and malignant tumours, inflammation or asthma.  
CC The methods, inhibitors and compositions of the invention that inhibit  
CC expression or activity of a gene or gene product may be used to treat  
CC patients having, or predisposed to developing, a disease responsive to  
CC inhibition of the gene. These may also be used to activate silenced genes  
CC to provide missing gene functions and improve a given condition.  
CC Furthermore, the methods and compositions are useful as probes of the  
CC physiological function of a gene product in an experimental cell culture  
CC or animal system; and to evaluate the effect of inhibiting gene activity  
CC or expression. AAAS5758 to AAAS5842 represent oligonucleotide sequences  
CC which are used in the exemplification of the present invention

PT Estrogen receptor gene and protein polymorphisms useful for diagnosis of  
 PT individuals at risk of developing bone disorders.

XX Example 2, Page 56; 245bp; English.

CC The invention relates to a novel isolated peptide comprising or  
 CC consisting of an amino acid sequence selected from an amino acid sequence  
 CC of a variant oestrogen receptor protein (e.g. ERbeta), or a fragment of  
 CC 10 amino acids, antibodies against them, nucleic acids encoding them  
 CC (including vectors for transforming cells). The gene for human ERbeta is  
 CC located on chromosome 6q.25.1. The variants are encoded by single  
 CC nucleotide polymorphisms (SNP). The variant peptides and proteins can be  
 CC used in assays to determine the biological activity of the protein, to  
 CC raise antibodies, as a reagent in assays designed to quantitatively  
 CC determine levels of the protein in biological fluids, to identify  
 CC compounds that modulate receptor activity and to screen compounds for the  
 CC ability to stimulate or inhibit interaction between the receptor protein  
 CC and a target molecule that normally interacts with the receptor protein  
 CC e.g. oestrogen. The antibody can be used to isolate the protein, to  
 CC assess expression in disease states e.g. cardiovascular disease and  
 CC autoimmune disease (e.g. systemic lupus erythematosus, arthritis,  
 CC rheumatism and osteoarthritis), osteoporosis, breast cancer and  
 CC endometrial cancer. In addition the antibodies can be used in

CC pharmacogenomic analysis and inhibiting protein function, e.g. blocking  
 CC the binding of the oestrogen receptor protein to a binding partner such  
 CC as a ligand. The nucleic acids encoding the proteins can be used as  
 CC probes, primers, chemical intermediates and in biological assays. The  
 CC present sequence is a 3' splice acceptor site from the human ERbeta gene

PT Detecting contaminating microorganisms in brewing, by nucleic acid  
 PT amplification and hybridization, either non-specific or genus- or species  
 PT -specific.

XX Claim 9(i); Page 18; 48bp; German.

CC This invention describes a novel method for detecting microorganisms (A)  
 CC of importance in brewing which comprises treating a sample with at least  
 CC two primers (P1) that hybridize to a consensus region in the nucleic acid  
 CC of (A), at least part of the microbial nucleic acid is amplified, the  
 CC amplicon is treated with at least one probe (P2) that hybridizes  
 CC specifically with a sequence common to all (A) or specific for one or  
 CC more families, genera or species, and any formation of hybrids is  
 CC detected. The method is used to detect, identify and/or characterize  
 CC microorganisms in beer or brewing materials, particularly for detecting  
 CC contamination. The method may detect the entire range of contaminating  
 CC microbes, either as a general test for contamination or as a test  
 CC specific for particular genera or (sub)species. It is quicker than known  
 CC microbiological methods, and can detect several organisms in the same  
 CC sample, including organisms not presently recognized as contaminants. The  
 CC method provides an early indication of contamination and can be automated  
 CC for high throughput analysis

New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-1 and probes for detecting the amplified product are specific for gag and pol regions and are useful to detect different subtypes of HIV-1.

Claim 1; Page 27; 37pp; English.

This invention relates to a series of nucleic acid oligomers for amplifying and detecting a nucleotide sequence of human immunodeficiency virus type 1 (HIV-1). The invention also comprises a labeled oligonucleotide that specifically hybridises to an HIV-1 sequence derived from gag or pol sequences, having one of the sequences fully defined in the specification, and a method for detecting HIV-1 in a biological sample, comprising mixing the sample with two or more of the amplification oligomers that specifically amplify at least one HIV-1 target sequence within gag and a pol sequence which is a protease or reverse transcriptase sequence, amplifying the target, and detecting the amplified product. The oligonucleotides of the invention may be used to diagnose HIV-1 infection. The presents sequence represents a PCR primer used to amplify the HIV-1 Gag gene in the HIV detection method of the invention. (Updated on 29-AUG-2003 to standardise OS field)

New ABC11 nucleic acids and proteins, useful in manufacturing a medicament for treating and/or preventing paroxysmal kinesigenic choreoathetosis, or pathologies linked to the transport of lipophilic substances.

Disclosure; Page 43; 118pp; English.

The invention relates to novel ABC11 nucleic acids and proteins. ABC11 sequences are used in the manufacture of a medicament for treating and/or preventing subjects affected by paroxysmal kinesigenic choreoathetosis. They may be used for treating or preventing subjects affected by a dysfunction of the transport of anionic drugs such as methotrexate, or neutral drugs conjugated to acidic ligands such as GSH, glucuronate, or sulphate conjugated drugs. Compositions comprising the ABC11 polypeptide may also be used in the treatment and/or prevention of a deficiency in the transport of cholesterol or inflammatory lipid substances and diseases mapped on the chromosome locus 16q12. ABC11 protein can be used to treat pathologies linked to the transport of lipophilic substances. The invention is used in gene therapy. The present sequence is human ABC11 exon/intron junction site

XX New antisense compounds targeted to nucleic acid molecule encoding
XX caspase 2, useful for treating diseases or conditions associated with
XX caspase 2, e.g. cancer, blood disorders, stroke, brain injury and
XX neurodegenerative diseases.
XX
XX Claim 3; Page 98; 146pp; English.
XX
XX The invention relates to a compound 8-50 nucleobases in length targeted
XX to a nucleic acid molecule encoding caspase 2, which specifically
XX hybridises with and inhibits the expression of caspase 2, or specifically
XX hybridises with at least an 8-nucleobase portion of an active site on a
XX nucleic acid molecule encoding caspase 2. The activity of antisense
XX oligonucleotides of the invention may be described as, cytostatic,
XX osteopathic, cerebroprotective, neuroprotective, antileptemic,
XX antiinflammatory and antimicrobial. The antisense compounds are useful
XX for treating an animal having a disease or condition associated with
XX caspase 2, such as haematopoietic disorder, bone metabolism disorder,
XX cholesterol disorder, or a hyperproliferative disorder. These compounds
XX may further be used as research reagents and diagnostics, to distinguish
XX between functions of various members of a biological pathway, in the
XX treatment of a disease or disorder which can be treated by modulating the
XX expression of caspase 2, including cancer, blood disorders, stroke, brain
XX injury and neurodegenerative diseases. They may also be used for
XX prophylaxis, e.g. to prevent or delay infection, inflammation or tumour
XX formation. Records ABN74810-ABN74952 represent caspase 2 mRNA inhibitor

 XX Novel variant of oestrogen receptor alpha polypeptide useful for  
 PT determining the biological activity of a protein for high throughput  
 PT screening and for raising antibodies that elicit an immune response in  
 PT host.  
 XX  
 XX Example; Page 57; 33pp; English.  
 PS  
 XX The present invention describes an isolated peptide (I) consisting of an  
 CC amino acid sequence selected from: (a) the amino acid sequence of a  
 CC variant of the oestrogen receptor alpha (ESR-alpha) protein in AAG68251;  
 CC or (b) a fragment comprising at least 10 contiguous amino acids of the  
 CC protein in AAG68251. (I) has cytostatic, osteopathic, cardiant and  
 CC vasoconstrictor activities, and can be used in gene therapy and vaccine  
 CC production. (I) is useful for identifying an agent that binds to (I), by  
 CC contacting (I) with an agent and assaying the contacted mixture to  
 CC determine whether a complex is formed with the agent bound to the  
 CC peptide. A polynucleotide (II), encoding (I), is useful in the  
 CC development of diagnostic and therapies for diseases and disorders  
 CC mediated/modulated by an oestrogen receptor (ER). (II) is also useful in  
 CC gene therapy for treating cancer, osteoporosis and cardiovascular  
 CC diseases. The human ESR-alpha gene is located on chromosome 6. ABA89779  
 CC to ABA89828 represent oligonucleotides covering human ER exon-intron  
 CC boundaries, and ABA89829 to ABA89868 represent oligonucleotides covering  
 CC human synaptic nuclei expressed gene 2 exon-intron boundaries, which are  
 CC used in an example from the present invention

XX Constructing strains for identifying gene products as effective targets
XX for therapeutic intervention, by inactivating in the strain one allele of
XX a gene and placing other allele of the gene under conditional expression.
XX Claim 36; SEQ ID NO 4081; 167pp + Sequence Listing; English.
XX The invention relates to constructing (M1) a strain of diploid fungal
XX cells in which both alleles of a gene are modified, comprising modifying
XX one allele by insertion or replacement by a cassette having an
XX expressible selectable marker and modifying other allele by
XX recombination, of a promoter replacement fragment with a heterologous
XX promoter, so that expression of the second allele is regulated by the
XX promoter. (M1) is useful for constructing a strain of diploid fungal
XX cells in which both alleles of a gene are modified. The diploid fungal
XX cells having both alleles modified are useful for identifying a gene that
XX is essential to the survival or growth of a fungus, a gene that
XX contributes to the virulence and/or pathogenicity of a fungus, a gene
XX that contributes to the resistance of a diploid fungus to an antifungal
XX agent, an antifungal agent that inhibits the growth of a diploid fungus
XX and for identifying a therapeutic agent for treatment of a mammalian
XX disease. (M1) is useful for identifying a compound which modulates the
XX activity of a gene product, preferably enzymatic activity, carbon
XX compound catabolism, biosynthetic, transporter, transcriptional,
XX translational, signal transduction, DNA replication and cell division
XX activity. The method is useful for identifying a compound having the
XX ability to inhibit growth or proliferation of C. albicans cells and for
XX treating infection by C. albicans. The present sequence is that of a PCR
XX primer used in the method of the invention. Note: The sequence data for
XX this patent is not represented in the printed specification but is based
XX on sequence information supplied to Derwent by the European Patent Office

XX
XX Novel antisense compound targeted to nucleic acids encoding human or
XX mouse CCAAT/enhancer binding protein (C/EBP) beta, useful in vitro for
XX inhibiting expression of human or mouse C/EBP beta in cells/tissues.
XX
XX Example 17; Col 49-50; 69pp; English.
XX
XX Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted
XX to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)
XX gene, which inhibit its expression. The antisense oligonucleotides were
XX designed to target different regions of the human and/or mouse C/EBP
XX alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels
XX by quantitative real-time PCR. The C/EBP family of proteins are a family
XX of transcription factors which regulate the expression of a wide range of
XX genes that control normal tissue development, cellular function, cellular
XX proliferation and functional differentiation. C/EBP beta (also known as
XX C/EBP2, LAP, TCF5, CRP2, NFIL6, IL6DBP, NF-M, ACP/EBP and ACP/EBP)
XX primarily regulates hormone responsiveness and oxidative stress responses
XX and is a mediator of IL-6 (interleukin-6) signalling. C/EBP beta is
XX thought to be involved in carbohydrate metabolism, immunity, the Th1
XX response, female fertility and gluconeogenic pathways. C/EBP beta is
XX expressed in the liver, lung, spleen, kidney, brain, and testis, with the
XX highest expression found in the lung. It is also expressed at a higher
XX level in malignant ovarian tissue compared with normal ovarian tissue,
XX and its expression in pancreas is upregulated in response to chronically
XX elevated levels of glucose, indicating that it is involved in the
XX impairment of insulin secretion in type II diabetes. The oligonucleotides
XX of the invention are useful for diagnosis, prevention and treatment of
XX conditions associated with C/EBP beta expression, such as cancer
XX (particularly ovarian cancer), tumour formation, diabetes (particularly
XX type II diabetes), infection, or inflammation

PT New antisense oligonucleotide which modulates expression of caspase 9,  
 PT useful to treat tumor, inflammation or to prevent infection in humans.  
 XX  
 PS Claim 26; Page 91; 145pp; English.

CC The present invention relates to a new antisense compound targeted to a  
 CC nucleic acid molecule encoding caspase 9 (C9). The compound specifically  
 CC hybridises with and inhibits the expression of caspase 9. The invention  
 CC also describes an antisense compound that specifically hybridises with an  
 CC 8 nucleotide portion of an active site of the nucleic acid. The invention  
 CC is useful for inhibiting the expression of C9 in cells or tissues and is  
 CC also useful for treating an animal having a disease or condition  
 CC associated with C9, including a hyperproliferative, haematopoietic or  
 CC cholesterol disorder, bone metabolism disorder, stroke, brain injury or  
 CC neurodegenerative disease. The compound is commonly useful as a research  
 CC and diagnostics reagent. It is also useful to distinguish between  
 CC functions of various members of a biological pathway. The invention is  
 CC also useful prophylactically e.g. to prevent or delay infection,  
 CC inflammation or tumour formation. The antisense compound of the invention  
 CC is often preferred over native form because of enhanced cellular uptake,  
 CC enhanced affinity for nucleic acid target and increased stability in  
 CC presence of nucleases. The present nucleic acid sequence represents one  
 CC of a collection (ABK69249-ABK69396) of chimeric phosphorothioate  
 CC oligonucleotides having 2'-methoxyethyl (2'-MOE) wings. This sequence was  
 CC used in the methods of the invention for inhibition of caspase 9

 PT New nucleic acid oligomer, useful for detecting selected regions of gag  
 PT and pol genes of human immune deficiency virus, particularly for  
 PT assessing drug resistance.  
 XX  
 PS Claim 1; Page 63; 82pp; English.

XX The present invention provides a number of nucleic acid oligomers which  
 CC can be used to amplify the gag and pol genes of human immunodeficiency  
 CC virus type 1 (HIV-1). These are used to detect regions of the gag and pol  
 CC genes, especially regions associated with drug resistance, and also for  
 CC identifying genetic subtypes of the virus. The present sequence is an  
 CC oligomer of the invention. (Updated on 29-AUG-2003 to standardise OS  
 CC field)

 PT New compound having sequence targeted to nucleic acid encoding inhibitor-  
 PT kappa B kinase-gamma, useful for preparing composition for treating e.g.,  
 PT cancer, or inflammatory or autoimmune disorder.  
 XX  
 PS Claim 3; Page 77; 106pp; English.  
 XX  
 CC The invention relates to an antisense compound that is targeted to a

CC nucleic acid encoding inhibitor-kappa B kinase-gamma, specifically  
 CC hybridizing to the nucleic acid encoding inhibitor-kappa B kinase-gamma  
 CC and inhibiting its expression. Compounds of the invention are antisense  
 CC oligonucleotides comprising at least one modified internucleoside  
 CC linkage, which is a 2'-O-methoxyethyl sugar moiety, at least one modified sugar  
 CC moiety, which is a 2'-O-methoxyethyl sugar moiety, or at least one  
 CC modified nucleobase, which is a 5-methylcytosine. Preferably, the  
 CC antisense oligonucleotide is a chimeric oligonucleotide. The compound of  
 CC the invention is useful for preparing a composition for treating a  
 CC hyperproliferative disorder e.g., cancer, or an autoimmune or  
 CC inflammatory disorder. The methods are useful for inhibiting the  
 CC expression of inhibitor-kappa B kinase-gamma in cells or tissues, and  
 CC treating an animal having a disease or condition associated with  
 CC inhibitor-kappa B kinase-gamma. Sequences given in ADA44713-ADA44790  
 CC represent antisense oligonucleotides for the inhibition of human  
 CC inhibitor-kappa B kinase-gamma mRNA levels.

 PT Sequencing nucleic acid, useful particularly for identifying mutations,  
 PT by collision-induced dissociation mass spectrometry and comparing  
 PT measured and reference spectra.  
 XX  
 XX Example 1; Page 6; 21pp; German.  
 XX  
 CC This invention describes a method for sequencing nucleic acids comprising  
 CC comparing a value of a collision-induced dissociation (CID) spectrum,  
 CC calculated for an assumed sequence, with the measured spectrum, and  
 CC calculating the degree of correspondence. At least one position in the  
 CC assumed sequence is altered and the degree of correspondence calculated.  
 CC again. The correspondence between calculated and measured spectra is  
 CC determined using an algorithm which establishes whether, at a site being  
 CC examined, a measured value is present in the spectrum or not. A higher  
 CC degree of correspondence is assumed when the measured value has higher

CC intensity and reduced deviation from the exact value for m/z (m/z values  
 CC can be determined very exactly, whereas intensity values are more  
 CC difficult to measure). The algorithm may assume that the spectrum  
 CC corresponds exactly to the assumed sequence. Collision-induced  
 CC dissociation is generally initiated by breaking the 3'-carbon-oxygen bond  
 CC of the sugar residue, followed by loss of base and formation of two  
 CC complementary series of ions, with the differences in mass between  
 CC members of the series being determined by the nature of the base.  
 CC Sequence-specific m/z data can be acquired in seconds and for many  
 CC genomic applications can be used to detect minor variations without the  
 CC need for complete sequencing. The method is useful for sequencing nucleic  
 CC acids, especially to locate and identify point mutations, deletions and  
 CC insertions in known sequences. The method can be applied to significantly  
 CC longer sequences than known CID-based processes and significantly reduces  
 CC the number of false 'hits' and incorrect error reports. This sequence  
 CC represents an oligonucleotide used to illustrate the method of the  
 CC invention.

XX New zebrafish embryo cell line, which becomes a germ cell when introduced  
XX to a fish embryo, useful for making a germ line chimeric zebrafish, which  
XX is a valuable model for genetic studies of human diseases.  
XX

PS Example 2; Page 22; 45bp; English.

XX The present invention describes a fish embryo cell line, where a cell of  
XX the fish embryo cell line, after incubation in vitro for at least 24  
XX hours, will become a germ cell when introduced to a fish embryo. Also  
XX described: (1) making the fish embryo cell line; (2) an isolated fish  
XX embryo cell line obtained by the method of (1); (3) making a germ line  
XX chimeric fish; (4) a germ line chimeric fish obtained by the method of  
XX (3); and (5) cell culture media comprising a growth factor and fish cell  
XX conditioned medium, or a growth factor and a fish cell, where the growth  
XX factor is fibroblast growth factor or epidermal growth factor. The fish  
XX embryo cell line is useful for making a germ line chimeric fish.  
XX particularly zebrafish, which is a valuable model for genetic studies of  
XX human diseases. The present sequence represents a PCR primer for  
XX zebrafish neo, which is used in an example from the present invention

 PT New polo-like kinase 1 agent containing duplex RNAs antisense  
 PT oligonucleotides and inhibitory peptides, useful for treating disorders  
 PT with elevated PLK1 expression levels, such as proliferative diseases,  
 PT particularly cancer.  
 XX  
 PS Disclosure; Page 123; 123pp; English.  
 XX  
 CC This invention relates to a novel agent for inhibiting or reducing the  
 CC elevated expression levels of polo-like kinase 1 (PLK1), which are  
 CC associated with the development and progress of proliferative diseases,  
 CC such as cancer. Specifically, PLKs are serine/ threonine kinases that  
 CC play key roles in mitotic progression, contribute to centrosome  
 CC maturation, bipolar spindle formation and are key regulators of  
 CC cytokinesis. The present invention describes agents where at least one  
 CC short interfering RNA (siRNA), preferably an shRNA (hairpin), or  
 CC antisense RNA is directed against the PLK1 gene as active agent.  
 CC Additionally, the agent must comprise a nuclease inhibitor, for example,  
 CC aurin tricarboxylic acid (ATA) and an RNA specific promoter such as the  
 CC U6 or H1 promoters. Accordingly, the siRNAs targeted against human PLK1  
 CC are valuable antiproliferative agents, and likewise the phosphorochilate  
 CC antisense specific oligonucleotides (ASOs) which hybridise with human  
 CC PLK1 mRNA, inhibit PLK1 expression in tumour cells, such that they can be  
 CC described as having cytosstatic activity. This oligonucleotide sequence is  
 CC the antisense oligo p21 located in the 3' UTR that inhibits expression of  
 CC human PLK1 of the invention.

 PS Claim 3; Page 74; 108pp; English.  
 XX  
 CC The invention relates to antisense compounds targeted to a nucleic acid  
 CC molecule encoding human inhibitor-kappa B-R (also known as I-kappaB,  
 CC IKK, I-kappa-B-related, ikappa B, nuclear factor of kappa light  
 CC polypeptide gene enhancer in B-cells inhibitor-like 2 and NFkBIL2) to  
 CC inhibit its expression. Antisense compounds of the invention are useful  
 CC for treating diseases or conditions associated with the expression of  
 CC inhibitor-kappa B-R such as a heightened immune response involving  
 CC increased cytokine expression, or a result of infection (e.g. bacterial,  
 CC viral or parasitic). They are useful for diagnostics, therapeutics,  
 CC prophylaxis e.g. to prevent or delay infection, inflammation or tumour  
 CC formation, as research reagents and kits and in distinguishing between  
 CC functions of various members of a biological pathway. They are also  
 CC useful in antisense therapy. The present sequence is an oligonucleotide  
 CC targeted to human inhibitor-kappa B-R DNA

XX  
XX The invention relates to a novel pharmaceutical composition, which has a  
CC first active agent comprising an oligonucleotide antisense to the  
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
CC junctions of genes encoding a polypeptide associated with lung and/or  
CC nasal airway dysfunction and a second active agent comprising an  
CC antiinflammatory steroid and ubiquinone. A composition of the invention  
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
CC immunosuppressive, and cytostatic activity. The composition may have a  
CC use in antisense gene therapy. The composition is useful for treating or  
CC preventing a respiratory, lung or malignant disease or condition, also  
CC for enhancing the prophylactic or therapeutic respiratory effect of an  
CC antiinflammatory steroid in a subject, for reducing or depleting levels  
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
CC lung inflammation, lung allergies, or a respiratory disease or condition.

DR
XX
XX  Identifying regions of neoplastic growth in a human body, useful for
PT detecting or predicting metastasis, comprises administering to the human
PT body an antibody or peptide that specifically binds to a protein marker
PT of neoplastic growth.
XX
XX  Example 2; Page 22; 42pp; English.
PS
XX
XX  The invention relates to methods for identifying regions of neoplastic
CC growth in a human patient, especially for detecting or predicting
CC metastasis. The methods involve determining whether a neoplastic growth
CC marker protein is overexpressed, either by the use of an antibody
CC specific for the protein, or by the use of PCR or hybridisation to detect
CC nucleic acids encoding the marker proteins. A set of neoplastic growth
CC markers are disclosed (SAGE (serial analysis of gene expression) tags for
CC these are given in ADA26759-ADA26796), with protein tyrosine phosphatase
CC type IVA member 3 (also known as PRL-3) being a preferred neoplastic
CC growth marker. The neoplastic growth markers are specifically expressed
CC at a higher level in metastatic cancers, compared with advanced and early
CC stage cancers and normal cells from which the cancer is derived.
CC Overexpression of the neoplastic growth markers is taken as an indication
CC that the tissue has a propensity to metastasise. The invention also
CC encompasses methods for treating a patient with an advanced or metastatic
CC cancer, and for identifying candidate drugs for treating advanced or
CC metastatic cancers. The methods of the invention are useful for
CC identifying regions of neoplastic growth, for detecting or predicting
CC metastasis, or identifying candidate drugs for treating advanced or
CC metastatic cancers. The invention is particularly applicable to
CC gastrointestinal, prostate, breast or colorectal cancers. Antibodies
CC which bind to the neoplastic growth marker proteins are additionally
CC useful for diagnostic imaging and for targeting cytotoxic or
CC chemotherapeutic drugs. The present sequence represents a reverse
CC transcription-PCR (RT-PCR) primer used to study the upregulation of
CC neoplastic growth marker genes in an example of the invention.

DR
XX
XX  New antisense oligonucleotides for modulating acyl CoA cholesterol
PT acyltransferase-2, e.g. for preventing or treating diseases associated
PT with abnormal lipid or cholesterol metabolism, atherosclerosis,
PT cardiovascular disease.
XX
XX  Claim 3; Page 89; 112pp; English.
PS
XX
XX  The present invention relates to novel antisense oligonucleotides which
CC are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2)
CC nucleotide sequence (ACC42409-ACC42431), and mouse ACAT-2 (ACC42432-
CC ACC42457). The antisense oligonucleotides specifically hybridise with and
CC inhibit the expression of ACAT-2 nucleotide sequences (ACC42395 and
CC ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from
CC free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are
CC useful for treating an animal which has a disease or condition associated
CC with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a
CC condition involving abnormal cholesterol metabolism, atherosclerosis, or
CC cardiovascular disease

CC methods of their use. The invention further relates to a novel  
CC polynucleotide, or its complement, comprising a nucleic acid sequence  
CC flanked by first and second inverted repeats, where the polynucleotide  
CC transposes from a donor polynucleotide to a target polynucleotide at a  
CC frequency at least 50% greater than the frequency of transposition of a  
CC transposon comprising nucleotides 2664 to 4901 of a fully defined  
CC sequence of 4928 bp, as given in the specification. The compositions  
CC including the transposons and transposases have the following activities:  
CC hepatotropic, haemostatic, antimicrobial, and cytostatic. The compositions  
CC of the invention may be used in gene therapy to treat disorders. The  
CC methods and compositions of the present invention are useful for treating  
CC and/or preventing liver diseases such as haemophilia, Crigler-Najjar  
CC syndrome and ornithine transcarbamylase deficiency, and pulmonary  
CC infectious diseases, alpha-1-antitrypsin deficiency and lung cancer. This  
CC polynucleotide sequence represents a mutagenic primer of the plasmid  
CC containing a synthetic transposase named Sleeping Beauty (SB). The  
CC synthetic TC-1 like transposon system was reconstructed from sequences  
CC found in salmonid fish.

XX  
XX This invention describes a novel composition (a) a first active agent,  
CC comprising oligonucleotides, effective for alleviating  
CC bronchoconstriction, respiratory tract inflammation, allergies and  
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
CC surfactant depletion or hyposecretion, when administered to a mammal. The  
CC oligonucleotides are derived from a gene encoding or regulating  
CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)  
CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has antiasthmatic, antiinflammatory, antiasthmatic,  
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to  
CC prevent any unwanted effects due to it

 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT New polynucleotide from Bacillus subtilis, which encodes delta endotoxins  
 PT or pesticidal proteins, useful in plant genetic engineering, particularly  
 PT for producing plants that are resistant to lepidopteran or coleopteran  
 PT pests.  
 XX  
 PS Example 5; SEQ ID NO 42; 51bp; English.  
 CC  
 CC The present invention provides an isolated polynucleotide from Bacillus  
 CC thuringiensis (B.c.) strain KB59A-6 that encodes an active pesticidal  
 CC SVP toxin protein. The invention is useful in plant genetic engineering  
 CC particularly producing plants that express such gene in order to  
 CC effectively control various insects e.g. boll weevil, black cutworm etc.  
 CC The invention is also useful for conferring resistance in plants against  
 CC lepidopteran or coleopteran. The present sequence is a PCR primer used  
 CC to amplify Bacillus thuringiensis WAR gene.

 CC expression of a PAZ/PIWI domain-containing protein. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with PAZ/PIWI domain-containing protein, such as a  
 CC hyperproliferative disorder e.g. cancer, or a disease or condition  
 CC arising from aberrant cellular differentiation. They are also useful in  
 CC research and diagnostics for modulating the expression of PAZ/PIWI domain-  
 CC -containing protein. This sequence represents a human PAZ/PIWI domain-  
 CC containing protein antisense oligonucleotide.

XX New antisense compound targeted to a nucleic acid molecule encoding
XX regulem, useful for modulating expression of regulem or for treating
XX cancer or developmental disorders.
XX
XX Example 15; SEQ ID NO 21; 66bp; English.
XX
XX The invention relates to a compound targeted to a nucleic acid molecule
XX encoding regulem which specifically hybridises with the nucleic acid
XX molecule encoding regulem and inhibits the expression of regulem. The
XX compound, particularly the antisense oligonucleotide is useful in
XX modulating the function of nucleic acid molecules encoding regulem. The
XX antisense compound can also be used as research tools and diagnostics. It
XX can also be used as tools in differential and/or combinatorial analyses
XX to elucidate expression patterns of a portion or the entire complement of
XX genes expressed within cells and tissues. The compound can also be used
XX for treating diseases or conditions associated with regulem, preferably
XX hypoproliferative disorder, e.g. cancer or a developmental disorder. The
XX compound can also be used as prophylaxis, e.g. to prevent or delay
XX infection, inflammation or tumour formation. The present sequence
XX represents the human regulem antisense oligonucleotide.

PT A primer set and method useful for mapping at least the  
PT variation/mutation part of a plant gene using a gene polymorphism marker.

XX Claim 7; SEQ ID NO 242; 120pp; Japanese.

XX The present invention relates to a primer set and method for mapping at  
XX least the variation/mutation part of a plant gene using a gene  
XX polymorphism marker. A mutation site of the plant gene is mapped by  
XX utilizing a genetic polymorphism marker as follows: (a) genomic DNA is  
XX prepared from a plant homozygously having a mutation to be an object of  
XX the mapping; (b) A forward primer 1 containing a base corresponding to  
XX the gene polymorphic maker of one ecotype plant, a forward primer 2  
XX containing a base corresponding to the genetic polymorphism of the other  
XX ecotype plant and a reverse primer 3 based on the base sequence common  
XX with both the ecotype plants are prepared; (c) two kinds of  
XX oligonucleotides emitting fluorescence of different colors when the  
XX genetic polymorphism marker is detected are prepared; (d) an  
XX amplification reaction of the genomic DNA is carried out in the presence  
XX of the primers 1, 2 and 3 and the two kinds of the oligonucleotides; (e)  
XX the fluorescence intensity emitted from the resultant reactional product  
XX is detected and (f) the position on the genome of the mutation site is  
XX determined from the results of detection. The present sequence is a  
XX primer, used to illustrate the invention.

XX New antisense compound, having a sequence targeted to a nucleic acid  
XX encoding endothelial specific molecule-1 (ESM-1), useful for preparing a  
XX composition for treating e.g., diabetes, cancer or cardiovascular  
XX disorder.

XX Claim 3; SEQ ID NO 138; 555pp; English.

XX The invention describes a new antisense compound, having a sequence  
XX comprising 8-30 bp targeted to a nucleic acid encoding endothelial  
XX specific molecule-1 (ESM-1), that specifically hybridizes with the  
XX nucleic acid ESM-1 and inhibits its expression. Also described are: a  
XX composition; inhibiting the expression of ESM-1 in cells or tissues; and  
XX treating an animal having a disease or condition associated with ESM-1.  
XX The compound is useful for preparing a composition for treating diabetes,  
XX cancer, ischaemia or reperfusion injury, or angiogenic, immunological,  
XX cardiovascular or neurological disorder. This sequence represents an  
XX antisense oligonucleotide that can be used to modulate expression of  
XX endothelial specific molecule-1 (ESM-1).

PT	Novel single or multiple target oligonucleotide anti-sense to e.g.			
PT	initiation codon, intron of respiratory disease-relevant gene e.g. CCR1,			
PT	RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.			
XX	asthma.			

PS	Claim 2, SEQ ID NO 1326; 174pp; English.
XX	The invention relates to oligonucleotides anti-sense to an initiation
CC	codon, coding region, 5' or 3' intron-exon junction, intron or region
CC	with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC	chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC	-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC	tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC	also relates to a method of screening a candidate compound that binds to
CC	one or more nucleic acid target(s) or expressed product(s), for the
CC	prevention and/or treatment of a respiratory or lung disease. The
CC	oligonucleotides are useful for reducing or inhibiting expression of a
CC	gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC	CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
CC	tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC	useful for preventing or treating a respiratory or lung disease. The
CC	respiratory or lung disease is associated with hyper-responsiveness to
CC	and/or increased levels of, adenosine and/or levels of adenosine A
CC	receptor(s), and/or asthma and/or lung allergies associated with
CC	inflammation or an inflammatory disease. The respiratory or lung disease
CC	is chosen from airway inflammation, allergy, asthma, impaired respiration,
CC	cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC	allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC	hypertension, lung inflammation, bronchitis, airway obstruction or
CC	bronchoconstriction. This sequence represents an oligonucleotide of the
CC	invention.

XX New antisense oligonucleotides useful for modulating expression of  
 PT Farnesoid X Receptor (FXR) or for treating diseases associated with FXR,  
 PT e.g. diabetes, immunological disorders, cardiovascular disorders,  
 PT gallstones or obesity.

PS Claim 4; SEQ ID NO 724; 150pp; English.

XX The invention relates to an antisense compound 8-30 nucleobases in length  
 CC targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR),  
 CC where the antisense compound specifically hybridizes with and inhibits  
 CC the expression of FXR. The composition and methods are useful for  
 CC inhibiting the expression of FXR (Farnesoid X receptor) in cells or  
 CC tissues, or for treating diseases or conditions associated with FXR, such  
 CC as diabetes, immunological disorders, cardiovascular disorders, e.g.  
 CC dyslipidemia and its symptoms, atherosclerosis, low HDL (high density  
 CC lipoprotein), elevated LDL (low density lipoprotein) or  
 CC hypercholesterolemia, gallstones, hypertriglyceridemia, obesity,  
 CC neurological disorders, or ischemia/reperfusion injury. In addition, the  
 CC composition is used for diagnostics, prophylaxis, or as research reagents  
 CC or kits. This sequence corresponds to an antisense oligonucleotide of the  
 CC invention.

XX Typing genes that contain polymorphic microsatellite loci, useful for  
 PT identifying predisposition to disease, by amplification and determining  
 PT length of amplicons.

PS Example 3; Page 26; 64pp; German.

XX The invention describes a method of typing (M1) a gene (I) that has one  
 CC or more polymorphic microsatellite loci (PMU). The method comprises: PCR  
 CC amplification of at least one DNA region of (I) that includes PMU, using  
 CC as template a DNA sample containing at least one segment of (I); and  
 CC determining the length of the resulting amplicon(s). Also described are:  
 CC a method of determining (M2) microsatellite markers (MM) for  
 CC predisposition to a disease, associated with a gene that includes one or  
 CC more PMU, and prediagnosis (M3) of diseases associated with gene that  
 CC include PMU. The method is used to identify microsatellite markers, in a  
 CC disease-related gene, that are associated with a predisposition to  
 CC diseases and for prediagnosis of such diseases, especially prion diseases  
 CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and  
 CC metabolic diseases; also to type genes that encode milk proteins,  
 CC hormones or transcription factors. The method is simpler, quicker and  
 CC particularly less expensive than known methods based on sequencing. This  
 CC sequence represents a primer used to genotype a region of the sheep prion  
 CC protein (Prp) comprising a polymorphic microsatellite locus.

XX
XX New compounds, particularly antisense oligonucleotides targeted to a
XX nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
XX (GFAT), for treating diabetes, a cardiovascular or neurologic disorder,
XX ischemia/reperfusion injury.
XX
XX Claim 4; SEQ ID NO 886; 175pp; English.
XX
XX The present invention relates to a compound which specifically hybridizes
XX with a nucleic acid molecule encoding GFAT, and inhibits the expression
XX of GFAT. Specifically claimed are antisense oligonucleotides capable of
XX modulating the expression of GFAT, and which comprise any of the 3063
XX sequences of 20 base pairs, given in the specification. The compound,
XX composition and methods are useful for treating a disease or condition
XX associated with GFAT, such as a disease or condition, e.g. diabetes, a
XX cardiovascular or neurological disorder, ischemia/reperfusion injury.
XX They are also useful in research and diagnostics for modulating the
XX expression of GFAT. The present sequence represents a chimeric
XX phosphorothioate oligonucleotide with 2'-MO3 wings and a deoxy gap, these
XX oligonucleotides inhibit human GFAT expression.

```

PT the genes.
XX
XX Claim 58; SEQ ID NO 2275; 1762pp; English.
XX
XX The present invention relates to diagnosing or monitoring transplant
XX rejection, e.g. cardiac or kidney transplant rejection, in an individual
XX comprises detecting the expression level of one or more genes. The
XX methods, system and kits are useful in diagnosing or monitoring
XX transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic
XX islet, lung, bone marrow or stem cell transplant rejection,
XX xenotransplant rejection or mechanical organ replacement rejection,
XX an individual. The method is also useful in assessing the immune status of
XX an individual. The method are also useful in diagnosing and monitoring
XX diseases that involve the immune system, e.g. rheumatoid arthritis,
XX lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or
XX viral, bacterial or fungal infection. The present sequence represents a
XX probe for a 50 mer oligonucleotide marker for diagnosis and monitoring of
XX allograft rejection and other disorders.

 XX Analyzing multiple targets in polynucleotide, by providing multiple  
 PT primers with target nucleic acid, digesting nucleic acid products with  
 PT cognate restriction enzymes, amplifying digested products, and detecting  
 PT amplified products.  
 PS Example 1; SEQ ID NO 18; 65pp; English.  
 XX  
 XX The invention relates analysing multiple targets in polynucleotide.  
 CC involves providing a set or sets of multiple primers with target nucleic  
 CC acids in separate reactions of primer extension or amplification, where  
 CC the reactions produce nucleic acid products in that each nucleic acid  
 CC fragments comprise at least one restriction site, digesting nucleic acid  
 CC products of the separate reactions on the restriction sites with cognate  
 CC restriction enzymes, joining digested products derived from the separate  
 CC reactions together, where randomly joining nucleic acid fragments from  
 CC the separated reactions are created, amplifying the joined products, and  
 CC detecting the amplified products. Also included are an oligonucleotide  
 CC primer for detecting target nucleic acid sequence (comprising a 3'  
 CC complementary portion and 5' non-complementary portion, where the 5' non-  
 CC complementary portion comprises a restriction enzyme site, where the  
 CC restriction site acts as detection marker in the process of detecting  
 CC target nucleic acid sequence, where the detection signal generated from  
 CC enzymatic manipulation on restriction site of reaction product is  
 CC indicative of the presence of target nucleic acid sequence) and a kit for  
 CC use in analysis and detection of multiple targets in a polynucleotide  
 CC (comprising a set or sets of multiple primers, universal primers,  
 CC restriction enzymes, DNA ligase, DNA polymerase, ddNTP, buffers for all  
 CC enzymes, and dNTPs). The method is useful for analysing multiple targets  
 CC in a polynucleotide and for genotyping mutations, preferably single  
 CC nucleotide polymorphisms (SNPs), and for analysing differential gene  
 CC expression profiles, genomic methylation patterns and any specific  
 CC nucleic acid from any source. The method enables analysis of multiple  
 CC targets quantitatively. An experiment was performed, using the method of  
 CC the invention, where 8 SNPs were detected in human genomic DNA,  
 CC simultaneously. The present sequence is a primer used in the above  
 CC experiment.

High throughput haplotype analysis, useful for diagnosing a disease condition, comprises diluting a nucleic acid sample into a single molecule dilution and genotyping by PCR.

Example; SEQ ID NO 44; 33bp; English.

The invention relates to a novel method for determining a haplotype of a subject. The method comprises: diluting a nucleic acid sample from the subject into a single molecule dilution; amplifying the diluted single nucleotide dilution with at least two different primers designed to amplify a region comprising at least two polymorphic sites in the nucleic acid template; genotyping the polymorphic sites in the single nucleic acid molecule; and determining the haplotype from the genotypes of at least two polymorphic sites to obtain a haplotype for the subject. The invention further comprises: a method of diagnosing a disease condition or disease susceptibility by determining a disease related haplotype in a subject, comprising the steps of the method above, and comparing the haplotype of the subject to known diseases-associated haplotypes, where a match in the sample haplotype with a disease-associated haplotype indicates that the subject has the disease or that the subject is susceptible for the disease. The method is useful for determining a haplotype of a subject. The method is used in pharmacogenomic, diseases pathogenesis, and molecular epidemiologic studies, for determining the differences in disease risk or susceptibility, and for determining treatment response between patients. This polynucleotide sequence represents a primer used in the haplotype determining method of the invention.

New antisense compounds targeted to nucleic acid molecules encoding acyl-coenzyme A synthetase 1 (ACS1), useful for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes, obesity or cancer.

Claim 3; SEQ ID NO 2467; 940bp; English.

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACS1). The antisense compound specifically hybridizes with and inhibits the expression of ACS1. The antisense oligonucleotides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACS1), and for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular disease or cancer. The antisense compounds are also useful as research reagents or kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents an acyl-coenzyme A synthetase 1, ACS1, antisense oligonucleotide.

PS
XX
XX The sequence is that of a bovine microsatellite sequence obtd. by
CC screening a library of bovine MboI DNA fragments of between 250 and 500
CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC clones cross-hybridised. Assuming independent distribution of
CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC in the bovine genome is estimated at >100,000. The sequence information
CC for ca. 230 such bovine microsatellites is summarised in the
CC specification and indexed herein (see below). The sequences upstream and
CC downstream of the microsatellite sequence were used to generate the
CC required PCR primers for in vitro amplification of the corresp.
CC microsatellite (using the program OPTIPRIM). The microsatellites may be
CC used to identify individuals, for parentage testing, and in the genetic
CC mapping of economic trait loci, or genes involved in the determination of
CC economically important traits esp. in cattle, to allow selective
CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

 XX Enzymatic nucleic acid molecules having a hammer-head motif - used for  
 PT the treatment of arthritis, induction of graft tolerance or treatment of  
 PT auto-immune diseases.  
 XX  
 PS Claim 10; Page 204; 307pp; English.  
 XX  
 CC The present invention describes a novel enzymatic nucleic acid (ENA)  
 CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues  
 CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least  
 CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's  
 CC can inhibit collagenase and stromelysin production in the synovial  
 CC membrane of joints for the treatment or prevention of arthritis.  
 CC Particularly osteoarthritis or rheumatoid arthritis. The ENA's can also  
 CC be used to treat antigen presenting cells of a donor to induce tolerance  
 CC in a recipient to an alloantigen or a donor. They can also be used for  
 CC enhancing graft tolerance or for treating autoimmune disease, and for  
 CC treating allergies and other inflammatory conditions. The ENA's can also  
 CC be used in diagnosis. Ribozyme therapy impacts on the expression of  
 CC stromelysin without introducing the non-specific effects upon gene  
 CC expression which accompany treatment with retinoids and dexamethasone.  
 CC The concentration of ribozyme required to affect a therapeutic treatment  
 CC is lower than that required of antisense molecules, and is highly  
 CC specific. The present sequence is used in the exemplification of the  
 CC present invention

PS      Example 1; Page 15; 37pp; English.
XX
CC      The present sequence represents PCR primer used to amplify cDNA encoding
CC      a mouse cystatin-related protein, designated testatin. The protein is
CC      capable of inducing testis formation in foetal gonads. It is highly
CC      probable that the protein inhibits testis tumour growth because of
CC      structural and functional similarities with tumour inhibiting cystatins.
CC      The cystatin-related protein testatin may be useful for inducing testis
CC      formation in foetal gonads. Testatin polynucleotides are useful as a
CC      source of primers and probes, which can be used to detect the presence of
CC      testatin nucleic acid molecules in a sample. The testatin
CC      polynucleotides, polypeptides, and compositions can be used for treating
CC      genital tumours and may also be useful for creating a model for studying
CC      testis malformations

 XX Ameliorating the effects of a disorder, e.g. psoriasis, by administering  
 XX UV (ultra-violet) treatment (optional) and an antisense nucleic acid that  
 XX inhibits or reduces growth factor mediated cell proliferation and/or  
 XX inflammation.  
 XX  
 XX Example 6; Page 35; 201pp; English.  
 XX  
 XX The present invention relates to a method for ameliorating the effects of  
 XX skin disorders. The method comprises contacting the skin with an  
 XX antisense oligonucleotide, (for insulin-like growth factor [IGF]-1  
 XX receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of  
 XX inhibiting or reducing growth factor mediated cell proliferation,  
 XX inflammation and/or other disorders. The present sequence is an  
 XX oligonucleotide which can be used to design the antisense  
 XX oligonucleotides of the present invention (see AAF45151 and AAF45153-  
 XX F45161). The method is useful for ameliorating the effects of psoriasis,  
 XX ichthyosis, pityriasis, ruba, pilaris, serborrhea, keloids, keratosis,  
 XX neoplasia, scleroderma, warts, benign growths, cancers of the skin, a  
 XX hyperneovascular condition such as a neovascular condition of the retina,  
 XX brain or skin, growth factor-mediated malignancies, other sclerotic  
 XX disease, kidney disease, hyperproliferation of the inside of blood  
 XX vessels or any other hyperplasia

 XX Typing genes that contain polymorphic microsatellite loci, useful for  
 XX identifying predisposition to disease, by amplification and determining  
 XX length of amplicons.  
 XX  
 XX Claim 9; Page 50; 64pp; German.  
 XX  
 XX The invention describes a method of typing (M1) a gene (I) that has one  
 XX or more polymorphic microsatellite loci (PML). The method comprises: PCR  
 XX amplification of at least one DNA region of (I) that includes PML, using  
 XX as template a DNA sample containing at least one segment of (I); and  
 XX determining the length of the resulting amplicon(s). Also described are:  
 XX a method of determining (M2) microsatellite markers (MM) for  
 XX predisposition to a disease, associated with a gene that includes one or  
 XX more PML; and predisposition (M3) of diseases associated with gene that  
 XX include PML. The method is used to identify microsatellite markers, in a  
 XX disease-related gene, that are associated with a predisposition to  
 XX diseases and for diagnosis of such diseases, especially prion diseases  
 XX but also cystic fibrosis, malignant hyperthermia syndrome in pigs and  
 XX metabolic diseases; also to type genes that encode milk proteins;  
 XX hormones or transcription factors. The method is simpler, quicker and  
 XX particularly less expensive than known methods based on sequencing. This  
 XX sequence represents a prion protein polymorphic microsatellite marker  
 XX consensus sequence.

 PT Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidaemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX  
 PS Example 59; SEQ ID NO 873; 483pp; English.  
 XX  
 CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (Apob) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antihypertensive, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cyrostatic,  
 CC endocrine, vasotrophic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human Apob RNA.

 PT New hairpin triplex-forming oligo:nucleotide targets a pyrimidine region  
 PT - has triplex forming and duplex forming regions connected by a linker,  
 PT combines properties of anti-gene and anti-sense molecules.  
 XX  
 PS Claim 9; Page 15; 48pp; English.  
 XX  
 CC New hairpin triplex-forming oligonucleotides comprise a duplex-forming  
 CC region (DPR), a triplex-forming region (TFR) and a linker (L). The DPR is  
 CC complementary to a pyrimidine region of target nucleic acid (1) so it can  
 CC hybridise both with DFR, forming a hairpin duplex, and with the duplex  
 CC formed between DFR and the target region (forming a triplex). DPR and TFR  
 CC have opposite polarity and are connected by L. The hairpin triplex-  
 CC forming oligonucleotides which combine functions of antigene and  
 CC antisense molecules, are used to modulate expression of (1) that includes  
 CC a homopyridine sequence, e.g. for in vivo or in vitro gene modulation  
 CC studies (as an alternative to modulating genes by deletion mutation) or  
 CC for therapeutic purposes, e.g. in cases of viral (esp. HIV), bacterial,  
 CC fungal, protozoal etc. infections, cancer, or generally any disease  
 CC associated with abnormal cell proteins. The present sequence is a part of  
 CC a claimed triplex-forming oligonucleotide. The oligonucleotide exists in  
 CC parallel double helical hairpin structure under experimental conditions.  
 CC In the presence of a single-stranded pyrimidine target sequence that is  
 CC complementary to the purine strand, however, the oligonucleotide forms an  
 CC antiparallel duplex via Watson-Crick hydrogen bonding. The pyrimidine  
 CC strand of the oligonucleotide remains bound in the major groove of the  
 CC antiparallel duplex in parallel fashion to the purine strand through  
 CC Hoogsteen hydrogen bonding

XX A transgenic non-human mammal expressing immunoglobulin E heavy chain,  
PT useful for testing of anti-human IgE antibodies.  
PS Disclosure; Page 6; 10pp; German.  
XX  
XX This invention describes a novel transgenic non-human mammal (1) which  
CC comprises human immunoglobulin E (IgE) heavy chain (II) in place of an  
CC endogenous Ig heavy chain gene at the immunoglobulin gene locus,  
CC the resulting expression of the endogenous gene. (1) is useful for the  
CC testing of medicaments, especially anti-human IgE antibodies or peptides  
CC with binding specificity against human IgE or against molecules that can  
CC interact with human IgE in humans. Anti-Fcεpsilon1 or RII antibodies and  
CC antisense oligonucleotides against the human IgE heavy chain gene can  
CC also be tested on (1). Allergen-specific humanized IgE antibodies are  
CC useful for in vitro diagnosis as an allergen-specific human IgE standard  
CC to quantify concentrations of allergen-specific IgE. The allergen can be  
CC plant pollen, fungal spores, house dust mites and pets or their metabolic  
CC products, insect poisons and foodstuffs. This sequence represents a PCR  
CC primer used to amplify the murine IgG1 constant region which is used in  
CC the method of the invention

PT Genomic DNA encoding a tumour rejection antigen precursor - processed to  
PT antigen presented by HLA-A2, useful for treating or diagnosing melanoma.  
XX  
PS Claim 22; Page 24; 41pp; English.

XX  
CC The tumour rejection antigen precursor (TRAP) is processed to a tumour  
CC rejection antigen (TRA) presented by HLA-A2 molecules. TRA is used to  
CC generate cytotoxic T lymphocytes for treating cancer (esp. melanoma). It  
CC can also be used to raise specific antibodies, and when complexed with  
CC HLA-A2, it can be used to produce vaccines. Cytotoxic T lymphocytes so  
CC generated can be used in adoptive transfer or generated, or they can be  
CC using TRA or TRAP together with an adjuvant that facilitates entry into  
CC HLA-A2 presenting cells. Diagnostic methods involving the detection of  
CC expression of the TRAP (Melan-A) using the probes described in AAT11552  
CC and AAT11553 can be used in the detection of cancers. (Updated on 27-AUG-  
CC 2003 to correct OS field.)

PT New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,  
PT or as specific biomolecule capture probes for surface-enhanced laser  
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.  
XX

PS Disclosure; SEQ ID NO 1459; 214pp; English.

XX  
XX The present invention describes a human genome-derived myosin-like  
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-  
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1  
CC nucleic acids can be used as probes to detect, characterise and quantify  
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to  
CC provide initial substrates for the recombinant engineering of hGDMLP-1  
CC protein variants having desired phenotypic improvements, and for  
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be  
CC used as immunogens to raise antibodies that specifically recognise hGDMLP  
CC -1 proteins, as standards in assays used to determine the concentration  
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule  
CC capture probes for surface-enhanced laser desorption/ionisation, as  
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1  
CC production, and in vaccines or for replacement therapy. The  
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a  
CC disorder associated with the expression of hGDMLP-1, in particular heart  
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.  
CC The present sequence represents an oligomer used in the screening of the  
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.  
CC The sequence data for this patent did not form part of the printed  
CC specification, but was obtained in electronic format directly from WIPO

DR Enzymatic polynucleotide that down regulates expression of chloride
XX channel calcium activated gene, useful for treating Chronic obstructive
XX PT pulmonary disease (COPD), chronic bronchitis and asthma.
XX
PS Claim 4; Page 81; 152pp; English.
XX
CC The invention relates to enzymatic nucleic acid molecules that down
CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes
CC by cleaving RNA derived from the genes. The nucleic acid sequences are
CC useful as pharmaceutical agents for treating conditions such as chronic
CC obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic
CC fibrosis, obstructive bowel syndrome and any other diseases or conditions
CC that are related to or will respond to the levels of CLCA1 in a cell or
CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,
CC hence, are useful for treatment of a patient having a condition
CC associated with the level of CLCA1, where the invention further comprises
CC the use of one or more therapies under conditions suitable for the
CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,
CC antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The
CC nucleic acids of the invention are also used as diagnostic tools to
CC examine genetic drift and mutations within diseased cells or to detect
CC the presence of CLCA1 RNA in a cell. This sequence represents an
CC enzymatic nucleic acid molecule of the invention

PT Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX
PS Disclosure; SEQ ID NO 1459; Opp; English.
XX
CC The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as a agonist or
CC antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMLP-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63102

 PT  
 PS Claim 11; Col 40; 32pp; English.  
 XX  
 CC This sequence represents an antisense oligonucleotide (I) of the  
 CC invention. (I) are 8 to 30 nucleotides in length and inhibit the  
 CC expression of human inhibitor-kappa B kinase-beta (IKB-beta). (I)  
 CC inhibits the expression of human IKB-beta which plays a role in the  
 CC development of T-cell leukaemia and in the activation of inflammatory  
 CC responses. (I) is therefore useful for treating inflammatory diseases or  
 CC disorders with an inflammatory component such as asthma, juvenile  
 CC diabetes mellitus, Graves' disease, rheumatoid arthritis, allograft  
 CC rejection, inflammatory bowel disease, multiple sclerosis, contact  
 CC dermatitis, rhinitis and various allergies, or hyperproliferative  
 CC disorders such as leukaemias and other tumours. (I) may also be used for  
 CC detection of the above disorders

DR	Determining the susceptibility of an individual to a neuropsychiatric disorder (e.g. schizophrenia) or diagnosing or prognosing the disorder comprises using a pericentriolar material 1 marker in the Chromosomal region 8p21-22.
PT	Claim 9; Fig 6; 108pp; English.
PS	This invention describes a novel method of determining the susceptibility to or diagnosis of schizophrenia comprising using a marker located in the chromosomal region 8p21-22. The method involves determining the presence or absence in a test sample of a pericentriolar material 1 (PCMI) marker which is selected from any of the microsatellite repeats present in the NT 000501 contig on chromosome 8p21-22 or a polymorphic marker which is in linkage disequilibrium with the chromosome. The PCMI marker is preferably DBS261, DBS2615 or DBS2616 and lies within the PCMI gene. The novel method involves assessing two or more of the PCMI markers single nucleotide polymorphisms (SNPs). The PCMI gene is amplified, particularly within the intronic sequence 3' to exon 4, in exon 4, or in the intronic sequence 5' of exon 5. The PCMI marker is assessed by strand conformation polymorphic marker analysis, heteroduplex analysis or restriction fragment length polymorphism (RFLP) analysis. Schizophrenia therapy comprises screening an individual for a genetic predisposition to schizophrenia, where the predisposition is correlated with the PCMI marker and if a predisposition is identified, providing therapeutic treatment for the individual. Alternatively, the method comprises administering to a patient a substance that modulates the expression from the PCMI gene or a gene located within 1000 base of the PCMI locus. This sequence represents the human PCMI exon 19 splice donor region.

XX
XX The present invention describes a short interfering nucleic acid (siNA)
XX that downregulates expression of a mitogen-activated protein kinase
XX (MAPK) genes by RNA interference. Also described: (1) a method for
XX modulating expression of MAPK genes in cells, tissue explants or
XX organisms by introduction of siNA; (2) kits for in vitro or in vivo
XX delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)
XX vectors that express siNA and cells containing these vectors. MAPK siNAs
XX have cytostatic, anorectic, antidiabetic, antibacterial, antiinflammatory,
XX antiasthmatic, immunosuppressive, antibacterial, antirheumatic,
XX antidiarrhetic, antiparasitic and gastrointestinal activities. The MAPK
XX siNAs can be used to modulate the expression of MAPK genes, in cells,
XX tissue explants or organisms, e.g. for treating obesity; diabetes types I
XX and II; a wide range of tumours, and inflammatory diseases (asthma,
XX septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel
XX disease). They can also be used for drug screening; diagnosis; target
XX identification and validation; genetic engineering; pharmacogenomics;
XX studying gene function and gene mapping (e.g. of single-nucleotide
XX polymorphisms). The present sequence represents a MAPK siNA which is used
XX in the exemplification of the present invention.

PT Proteins with phosphatase activity useful for screening for substances
XX that affect their activity.
XX
PS Example 7; SEQ ID NO 43; 170pp; Japanese.
XX
CC The invention relates to novel isolated proteins comprising an amino acid
CC sequence represented by any of SEQ ID NOS: 8 to 14, 25 and 26; and a
CC protein comprising an amino acid sequence derived from an amino acid
CC sequence represented by any of SEQ ID NOS: 8 to 14, 25 and 26 by
CC deletion, substitution and/or addition of one to several amino acids and
CC having a phosphatase activity. The invention further comprises: the DNA
CC of optionally mutated sequences SEQ ID NOS: 1-7, 23 and 24 or those that
CC hybridise to them; DNA and cDNA encoding the proteins; vectors containing
CC the DNA; cells containing the vectors; proteins produced by the cells;
CC whole or fragments of antibodies against the proteins; screening for
CC substances that affect the expression and activity of the proteins; a
CC computer readable recording medium; and a solid support bound to the DNA.
CC The novel phosphatase proteins are useful for screening for substances
CC that affect the activity of the proteins, which have potential use in the
CC development of drugs for treating associated disorders. This
CC polynucleotide represents a PCR primer used in the exemplification of the
CC invention.

PT Genome sequence of Chlamydia trachomatis.
XX
XX PS Disclosure; Page 1646; 1755pp; English.
XX
XX PCR primers AA201426-206209 were used to amplify open reading frames
CC (ORFs) of the genome of Chlamydia trachomatis (see AA201425). These ORFs
CC encode polypeptides (see AA136754-Y31949) which can be used as vaccines
CC against Chlamydia trachomatis. Antisense and ribozyme sequences can also
CC be used to control growth of the microorganism. Chlamydia trachomatis is
CC responsible for a large number of diseases, e.g. eye diseases such as
CC conjunctival trachoma, nongonococcal urethritis,
CC epididymitis, cervicitis, salpingitis, perihepatitis, Bartholinitis,
CC pneumopathy in breast feeding infants, and venereal lymphogranulomatosis.
CC The polypeptides of the invention may be of use in treating these
CC diseases

PT Specifically inhibiting the growth of tumor cells that overexpress a
PT Rhomboid Related Protein (RRP) comprises contacting the tumor cells with
PT an amount of an exogenous RRP binding agent (e.g. an antibody) to inhibit
PT tumor growth.
XX
PS Example; Page 139; 146pp; English.
XX
CC The present invention describes a method of specifically inhibiting
CC growth of tumor cells that over-express a rhomboid related protein (RRP)
CC comprising contacting the tumor cells with an amount of an exogenous RRP
CC binding agent that results in the inhibition of growth of tumor cells.
CC Also described: (1) screening for agents that modulate the interaction of
CC an RRP polypeptide with an RRP binding target; (2) diagnosing a tumour
CC cell as having abnormal p53 or p21 pathway signaling; (3) identifying a
CC candidate p53 or p21 pathway modulating agent; (4) modulating a p53 or
CC p21 pathway of a cell; (5) diagnosing a disease in a patient; (6) a
CC purified nucleic acid molecule that encodes a RRP polypeptide, or its
CC reverse complement; (7) a recombinant expression system comprising a DNA
CC or RNA molecule, where the expression system is capable of producing an
CC mRNP1 polypeptide when the expression system is present in a compatible
CC host cell; (8) producing an mRNP1 protein; (9) producing a cell which
CC produces an mRNP1 protein; (10) a recombinant host cell comprising the
CC expression system of (7) or expressing the protein produced by method (8)
CC ; (11) a transgenic mouse whose genome comprises a disruption in an
CC endogenous RRP gene, where the disruption results in decreased expression
CC or a lack of expression of the endogenous RRP gene; (12) a cell isolated
CC from the transgenic mouse or whose genome comprises a disruption in an
CC endogenous RRP gene, where the disruption results in decreased expression
CC or a lack of expression of the endogenous RRP gene; (13) selecting an
CC agent that modulates cell proliferation; and (14) making an antibody
CC against a human RRP. RRP sequences have cyostatic activity, and can be
CC used in gene therapy. The method of the invention is useful in diagnosing
CC or specifically inhibiting the growth of tumor cells that over-express
CC an RRP protein. The RRP nucleic acid and polypeptide sequences can be
CC used for identifying and testing agents that modulate RRP function and
CC for other applications related to the involvement of RRP in the p53 or
CC p21 pathways. The present invention represents a PCR primer for mouse
CC RRP1, which is used in an example from the present invention.

XX Inhibition of growth of tumor cells overexpressing rhomboid related
XX protein, RRP, useful therapeutically to inhibit growth of e.g. breast
XX tumor cells by contacting with exogenous agent binding a RRP.
XX
XX Example; SEQ ID NO 56; 84pp; English.
XX
XX The present invention relates to growth of tumour cells overexpressing a
XX rhomboid related protein (RRP) which can be inhibited by contacting an
XX exogenous agent binding RRP, since RRP genes are modulators of the p53 or
XX p21 pathway. The invention is useful therapeutically to inhibit growth of
XX tumour cells overexpressing RRP especially from breast, ovary, lung,
XX kidney or colon. The invention is useful to identify agents which can
XX modulate and restore p53 or p21 and/or RRP activity. The present sequence
XX is mouse PCR probe used in the generation of targeted embryonic stem
XX (ES) cells.
